THE SPECIFICATIONS AND INFORMATION REGARDING THE PRODUCTS IN THIS MANUAL ARE SUBJECT TO CHANGE WITHOUT NOTICE. ALL STATEMENTS, INFORMATION, AND RECOMMENDATIONS IN THIS MANUAL ARE BELIEVED TO BE ACCURATE BUT ARE PRESENTED WITHOUT WARRANTY OF ANY KIND, EXPRESS OR IMPLIED. USERS MUST TAKE FULL RESPONSIBILITY FOR THEIR APPLICATION OF ANY PRODUCTS.

THE SOFTWARE LICENSE AND LIMITED WARRANTY FOR THE ACCOMPANYING PRODUCT ARE SET FORTH IN THE INFORMATION PACKET THAT SHIPPED WITH THE PRODUCT AND ARE INCORPORATED HEREIN BY THIS REFERENCE. IF YOU ARE UNABLE TO LOCATE THE SOFTWARE LICENSE OR LIMITED WARRANTY, CONTACT YOUR CISCO REPRESENTATIVE FOR A COPY.

The following information is for FCC compliance of Class A devices: This equipment has been tested and found to comply with the limits for a Class A digital device, pursuant to part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio-frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference, in which case users will be required to correct the interference at their own expense.

The following information is for FCC compliance of Class B devices: The equipment described in this manual generates and may radiate radio-frequency energy. If it is not installed in accordance with Cisco's installation instructions, it may cause interference with radio and television reception. This equipment has been tested and found to comply with the limits for a Class B digital device in accordance with the specifications in part 15 of the FCC rules. These specifications are designed to provide reasonable protection against such interference in a residential installation. However, there is no guarantee that interference will not occur in a particular installation.

Modifying the equipment without Cisco's written authorization may result in the equipment no longer complying with FCC requirements for Class A or Class B digital devices. In that event, your right to use the equipment may be limited by FCC regulations, and you may be required to correct any interference to radio or television communications at your own expense.

You can determine whether your equipment is causing interference by turning it off. If the interference stops, it was probably caused by the Cisco equipment or one of its peripheral devices. If the equipment causes interference to radio or television reception, try to correct the interference by using one or more of the following measures:

- Turn the television or radio antenna until the interference stops.
- Move the equipment to one side or the other of the television or radio.
- Move the equipment farther away from the television or radio.
- Plug the equipment into an outlet that is on a different circuit from the television or radio. (That is, make certain the equipment and the television or radio are on circuits controlled by different circuit breakers or fuses.)

Modifications to this product not authorized by Cisco Systems, Inc. could void the FCC approval and negate your authority to operate the product.

The Cisco implementation of TCP header compression is an adaptation of a program developed by the University of California, Berkeley (UCB) as part of UCB's public domain version of the UNIX operating system. All rights reserved. Copyright © 1981, Regents of the University of California.

NOTWITHSTANDING ANY OTHER WARRANTY HEREIN, ALL DOCUMENT FILES AND SOFTWARE OF THESE SUPPLIERS ARE PROVIDED "AS IS" WITH ALL FAULTS. CISCO AND THE ABOVE-NAMED SUPPLIERS DISCLAIM ALL WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING, WITHOUT LIMITATION, THOSE OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE AND NONINFRINGEMENT OR ARISING FROM A COURSE OF DEALING, USAGE, OR TRADE PRACTICE.

IN NO EVENT SHALL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES, INCLUDING, WITHOUT LIMITATION, LOST PROFITS OR LOSS OR DAMAGE TO DATA ARISING OUT OF THE USE OR INABILITY TO USE THIS MANUAL, EVEN IF CISCO OR ITS SUPPLIERS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

Index I-1

Preface

This preface describes who should read the *Cisco Service Control Application for Broadband Reference Guide*, how it is organized, its document conventions, and how to obtain documentation and technical assistance.

This guide assumes a basic familiarity with the concept of the Cisco Service Control solution, the Service Control Engine (SCE) platforms, and related components.

Document Revision History

Cisco Service Control Release	Part Number	Publication Date
Release 3.0.5	OL-8410-03	November, 2006

DESCRIPTION OF CHANGES

Added the following new feature:

- *Quota State Restore RDRs* (on page [2-24](#))

Cisco Service Control Release	Part Number	Publication Date
Release 3.0.3	OL-8410-02	May, 2006

DESCRIPTION OF CHANGES

Added the following new feature:

- *Media Flow RDR* (on page [2-29](#)) (see also *Table RPT_MEDIA* (on page [3-6](#)))

Added the following section to the document:

- *SCE Subscriber Template CSV File* (on page [4-5](#))

Cisco Service Control Release	Part Number	Publication Date
Release 3.0.0	OL-8410-01	December, 2005

DESCRIPTION OF CHANGES

Created the *Cisco Service Control Application for Broadband Reference Guide*.

Chapters 1, 2, 3 of this document are based on Appendixes B, C, D of the Release 2.5.5 *Cisco Service Control Application for Broadband User Guide*.

Audience

This guide provides information about the data structures created and used by *SCA BB*. It is intended for:

- The administrator who is responsible for daily operation of the Cisco Service Control solution
- Integrators who are developing applications on top of *SCA BB*

Document Content

This guide is organized as follows:

Chapter	Title	Description
Chapter 1	<i>Default Service Configuration Reference Tables</i> (on page 1-1)	Describes the default service configuration provided with the <i>Service Control Application for Broadband (SCA BB)</i> .
Chapter 2	<i>Raw Data Records: Formats and Field Contents</i> (on page 2-1)	Lists the various RDRs produced by the Service Control Engine (SCE) platform and gives their structure, describes the columns and fields of each RDR, and states under what conditions each kind of RDR is generated. Also provides field-content information for fields generated by Service Control components (such as tags), and a description of the Periodic RDR Zero Adjustment Mechanism.
Chapter 3	<i>Database Tables: Formats and Field Contents</i> (on page 3-1)	Presents the different database tables used for storing RDRs (after their conversion by an adapter), and a description of the table columns (field names and types).
Chapter 4	<i>CSV File Formats</i> (on page 4-1)	Describes the location and structure of CSV files pertaining to service configuration, subscriber management, and data collection management.
Chapter 5	<i>SCA BB Proprietary MIB Reference</i> (on page 5-1)	Describes that part of the Cisco SCE proprietary MIB that provides configuration and runtime status for <i>SCA BB</i> .

Related Publications

The following publications are available for the *Service Control Application for Broadband*:

- *Cisco Service Control Application for Broadband User Guide*
- *Cisco Service Control Application for Broadband Service Configuration API Programmer Guide*
- *Cisco Service Control Management Suite Collection Manager User Guide*
- *Cisco Service Control Management Suite Subscriber Manager User Guide*
- *Cisco Service Control Application Reporter User Guide*
- *Cisco Service Control Engine (SCE) Software Configuration Guide*

Conventions

This document uses the following conventions:

Convention	Description
boldface font	Commands and keywords are in boldface .
<i>italic font</i>	Arguments for which you supply values are in <i>italics</i> .
[]	Elements in square brackets are optional.
{x y z}	Alternative keywords are grouped in braces and separated by vertical bars.
[x y z]	Optional alternative keywords are grouped in brackets and separated by vertical bars.
string	A nonquoted set of characters. Do not use quotation marks around the string, or the string will include the quotation marks.
screen font	Terminal sessions and information that the system displays are in screen font.
boldface screen font	Information you must enter is in boldface screen font .
<i>italic screen font</i>	Arguments for which you supply values are in <i>italic screen font</i> .
< >	Nonprinting characters, such as passwords, are in angle brackets.
[]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

Note

Means *reader take note*. Notes contain helpful suggestions or references to materials not covered in this manual.

Caution

Means *reader be careful*. In this situation, you might do something that could result in loss of data.

Obtaining Documentation

The following sections provide sources for obtaining documentation from Cisco Systems.

World Wide Web

You can access the most current Cisco documentation on the World Wide Web at the following sites:

- <http://www.cisco.com>
- <http://www-china.cisco.com>
- <http://www-europe.cisco.com>

Documentation CD-ROM

Cisco documentation and additional literature are available in a CD-ROM package that ships with your product. The Documentation CD-ROM is updated monthly and may be more current than printed documentation. The CD-ROM package is available as a single unit or as an annual subscription.

Ordering Documentation

Cisco documentation is available in the following ways:

- Registered Cisco Direct Customers can order Cisco Product documentation from the networking Products MarketPlace:
http://www.cisco.com/cgi-bin/order/order_root.pl
- Registered Cisco.com users can order the Documentation CD-ROM through the online Subscription Store:
<http://www.cisco.com/pcgi-bin/marketplace/welcome.pl>
- Nonregistered Cisco.com users can order documentation through a local account representative by calling Cisco corporate headquarters (California, USA) at 408 526-7208 or, in North America, by calling 800 553-NETS(6387).

Documentation Feedback

If you are reading Cisco product documentation on the World Wide Web, you can submit technical comments electronically. Click **Feedback** in the toolbar and select **Documentation**. After you complete the form, click **Submit** to send it to Cisco.

You can e-mail your comments to bug-doc@cisco.com.

To submit your comments by mail, use the response card behind the front cover of your document, or write to the following address:

Attn Document Resource Connection
Cisco Systems, Inc.
170 West Tasman Drive
San Jose, CA 95134-9883

We appreciate your comments.

Obtaining Technical Assistance

Cisco provides *Cisco.com* (on page ix) as a starting point for all technical assistance. Customers and partners can obtain documentation, troubleshooting tips, and sample configurations from online tools. For Cisco.com registered users, additional troubleshooting tools are available from the TAC website.

Cisco.com

Cisco.com is the foundation of a suite of interactive, networked services that provides immediate, open access to Cisco information and resources at any time, from anywhere in the world. This highly integrated Internet application is a powerful, easy-to-use tool for doing business with Cisco.

Cisco.com provides a broad range of features and services to help customers and partners streamline business processes and improve productivity. Through Cisco.com, you can find information about Cisco and our networking solutions, services, and programs. In addition, you can resolve technical issues with online technical support, download and test software packages, and order Cisco learning materials and merchandise. Valuable online skill assessment, training, and certification programs are also available.

Customers and partners can self-register on Cisco.com to obtain additional personalized information and services. Registered users can order products, check on the status of an order, access technical support, and view benefits specific to their relationships with Cisco.

To access Cisco.com, go to <http://www.cisco.com>.

Technical Assistance Center

The Cisco Technical Assistance Center (TAC) website is available to all customers who need technical assistance with a Cisco product or technology that is under warranty or covered by a maintenance contract.

Contacting TAC by Using the Cisco TAC Website

If you have a priority level 3 (P3) or priority level 4 (P4) problem, contact TAC by going to the TAC website <http://www.cisco.com/tac>.

P3 and P4 level problems are defined as follows:

- P3—Your network is degraded. Network functionality is noticeably impaired, but most business operations continue.
- P4—You need information or assistance on Cisco product capabilities, product installation, or basic product configuration.

In each of the above cases, use the Cisco TAC website to quickly find answers to your questions.

To register for *Cisco.com* (on page ix), go to <http://tools.cisco.com/RPF/register/register.do>.

If you cannot resolve your technical issue by using the TAC online resources, Cisco.com registered users can open a case online by using the TAC Case Open tool at <http://www.cisco.com/tac/caseopen>.

Contacting TAC by Telephone

If you have a priority level 1 (P1) or priority level 2 (P2) problem, contact TAC by telephone and immediately open a case. To obtain a directory of toll-free numbers for your country, go to <http://www.cisco.com/warp/public/687/Directory/DirTAC.shtml>.

P1 and P2 level problems are defined as follows:

- P1—Your production network is down, causing a critical impact to business operations if service is not restored quickly. No workaround is available.
- P2—Your production network is severely degraded, affecting significant aspects of your business operations. No workaround is available.

Default Service Configuration Reference Tables

This chapter describes the default service configuration provided with the *Service Control Application for Broadband (SCA BB)*. The default service configuration serves as a starting point for creating a service configuration tailored to customers' needs.

This chapter contains the following sections:

- [Filter Rules](#) 1-1
- [Protocols](#) 1-3
- [Services](#) 1-33
- [RDR Settings](#) 1-35
- [Rules](#) 1-36
- [System Mode](#) 1-36

Filter Rules

Filter rules allow you to instruct the Service Control Engine (SCE) platform to ignore some types of flow based on the flow's Layer 3 and Layer 4 properties, and transmit the flows unchanged.

The following table lists the filter rules defined in the default service configuration.

Table 1-1 Filter Rules

Flow Filter Name	Default State	Description
ICMP Filter	Active	Applies to ICMP packets, packets bypass the policy engine and are mapped to CoS BE
DNS (to network)	Active	Applies to UDP packets, network-side port is equal to 53, packets bypass the policy engine and are mapped to CoS BE
DNS (to subscriber)	Active	Applies to UDP packets, subscriber-side port is equal to 53, packets bypass the policy engine and are mapped to CoS BE
net-bios (to network)	Active	Applies to UDP packets, network-side port is equal to 137, packets bypass the policy engine and are mapped to CoS BE

Filter Rules

Flow Filter Name	Default State	Description
net-bios (to subscriber)	Active	Applies to UDP packets, subscriber-side port is equal to 137, packets bypass the policy engine and are mapped to CoS BE
eDonkey UDP (to network)	Active	Applies to UDP packets, network-side ports in the range 4661 to 4665, packets bypass the policy engine and are mapped to CoS BE
eDonkey UDP (to subscriber)	Active	Applies to UDP packets, subscriber-side ports in the range 4661 to 4665, packets bypass the policy engine and are mapped to CoS BE
eMule UDP (to network)	Active	Applies to UDP packets, network-side ports in the range 4670 to 4674, packets bypass the policy engine and are mapped to CoS BE
eMule UDP (to subscriber)	Active	Applies to UDP packets, subscriber-side ports in the range 4670 to 4674, packets bypass the policy engine and are mapped to CoS BE
eMule UDP 2 (to network)	Active	Applies to UDP packets, network-side ports in the range 5670 to 5674, packets bypass the policy engine and are mapped to CoS BE
eMule UDP 2 (to subscriber)	Active	Applies to UDP packets, subscriber-side ports in the range 5670 to 5674, packets bypass the policy engine and are mapped to CoS BE
eMule UDP 3 (to network)	Active	Applies to UDP packets, network-side ports in the range 5780 to 5784, packets bypass the policy engine and are mapped to CoS BE
eMule UDP 3 (to subscriber)	Active	Applies to UDP packets, subscriber-side ports in the range 5780 to 5784, packets bypass the policy engine and are mapped to CoS BE
BGP Filter	Inactive	Applies to TCP packets, network-side port is equal to 179, packets bypass the policy engine and are mapped to CoS BE
DHCP Filter	Inactive	Applies to UDP packets, network-side ports in the range 67 to 68, packets bypass the policy engine and are mapped to CoS BE
OSPF Filter	Inactive	Applies to OSPFIGP packets, packets bypass the policy engine and are mapped to CoS BE
IS-IS Filter	Inactive	Applies to ISIS packets, packets bypass the policy engine and are mapped to CoS BE
IGRP Filter	Inactive	Applies to IGP packets, packets bypass the policy engine and are mapped to CoS BE
EIGRP Filter	Inactive	Applies to EIGRP packets, packets bypass the policy engine and are mapped to CoS BE
HSRP Filter 1	Inactive	Applies to UDP packets, network-side IP is equal to 224.0.0.2, packets bypass the policy engine and are mapped to CoS BE

Flow Filter Name	Default State	Description
HSRP Filter 2	Inactive	Applies to UDP packets, network-side port is equal to 1985, packets bypass the policy engine and are mapped to CoS BE
HSRP Filter 3	Inactive	Applies to UDP packets, subscriber-side port is equal to 1985, packets bypass the policy engine and are mapped to CoS BE
RIP Filter 1	Inactive	Applies to UDP packets, network-side IP is equal to 224.0.0.9, packets bypass the policy engine and are mapped to CoS BE
RIP Filter 2	Inactive	Applies to UDP packets, network-side port is equal to 520, packets bypass the policy engine and are mapped to CoS BE
RIP Filter 3	Inactive	Applies to UDP packets, subscriber-side port is equal to 520, packets bypass the policy engine and are mapped to CoS BE
RADIUS Filter	Inactive	Applies to UDP packets, network-side port is equal to 1812, packets bypass the policy engine and are mapped to CoS BE
RADIUS Filter (early deployment)	Inactive	Applies to UDP packets, network-side ports in the range 1645 to 1646, packets bypass the policy engine and are mapped to CoS BE

Protocols

Protocols are divided into four groups:

- **Generic Protocols**—These protocols are used for transactions that were not mapped to a service by one of the more specific protocol types.
- **Signature-Based Protocols**—Protocols classified according to a Layer 7 application signature. This group includes the most common protocols, such as HTTP and FTP, and a large group of popular P2P protocols.
- **IP Protocols**—Protocols (such as ICMP), other than TCP and UDP protocols, identified according to the IP protocol number of the transaction.
- **Port-Based Protocols**—TCP and UDP protocols that are classified according to their well-known ports. The default configuration includes more than 600 common port-based protocols.

You may add new protocols (for example, to classify a new gaming protocol that uses a specific port) and edit or remove existing ones.

The tables in the following sections list the protocols defined in the default service configuration.

Generic Protocols

The three generic protocols (IP, TCP, and UDP) serve as default containers for classifying transactions of the relevant type (IP, TCP, or UDP) that were not classified as belonging to a more specific protocol.

A transaction is classified as belonging to one of the generic protocols if it meets *both* the following conditions:

- It was not classified as belonging to a signature-based protocol.
- It was not classified as belonging to an IP or port-based protocol that is specifically mapped to a service.

Table 1-2 Generic Protocols

Protocol Name	ID	Description
Generic IP	10	Any non-TCP/UDP transaction where the related IP protocol is not specifically mapped to a service.
Generic TCP	0	Any TCP transaction that does not match any signature-based protocol, and where the related port-based protocol (if it exists) is not specifically mapped to a service.
Generic UDP	1	Any UDP transaction that does not match any signature-based protocol, and where the related port-based protocol (if it exists) is not specifically mapped to a service.

Signature-Based Protocols

A transaction is classified as belonging to one of the signature-based protocols if it is carried on the protocol's well-known port or matches the protocol's signature.

Table 1-3 Signature-Based Protocols

Protocol Name	ID	TCP Ports	UDP Ports
CUWorld	117		
DHCP Sniff	33		
DingoTel	42		
DNS	933		
FTP	4	21	
Generic Non-Established TCP See note following table	126		
Generic Upload/Download See note following table	127		
GoogleEarth	118		

Protocol Name	ID	TCP Ports	UDP Ports
Hopster	115		
HTTP Browsing	2	80, 8080	
HTTP Tunnel	55		
ICQ	119		
IRC	62		
Jabber	116		
MMS	6	1755	
Mobile MMS	46		
NNTP	15	119	
NTP	54		
POP3	9	110	
PTT Winphoria	61		
QQ	52		
RTSP Streaming	5	554, 1554, 7070	
Sling	112		
SMTP	8	25	
STUN	114		
Thunder	50		
UC	48		
Yahoo Messenger	40	5000-5001	5000-5001
imap	59	143	143
radius	738		
tftp	60	69	69

- Generic Non-Established TCP—TCP flows that are not established properly (syn-ack is missing) are mapped to this protocol.
- Generic Upload/Download—Transactions that have download packet flow characteristics and do not match a more specific signature are classified to this protocol. This protocol applies to downloads both from the network side and from the subscriber side.

Table 1-4 Signature-Based P2P Protocols

Protocol Name	ID	TCP Ports	UDP Ports
AntsP2P	113		
BaiBao	43		
BitTorrent	24	6881-6889	

Protocol Name	ID	TCP Ports	UDP Ports

Port-Based Protocols

This section lists the TCP/UDP port-based protocols defined in the *SCA BB* default service configuration.

Table 1-7 Port-Based Protocols (Ports 1 to 500)

Protocol Name	ID	TCP Ports	UDP Ports
compressnet	900	2-3	2-3
RJE	901	5	5
Echo	902	7	7
Discard	903	9	9
systat	904	11	11
daytime	905	13	13
qotd	906	17	17
misp	907	18	18
chargen	908	19	19
ftp-data	909	20	20

Protocols

Services

Services are the building blocks of service configurations. Classification of a transaction to a service determines the accounting and control that applies to the transaction. Services are organized in a hierarchal structure used for both accounting and control.

The following table lists the services defined in the default service configuration. Both service counters, which are used to accumulate information on transactions classified to the service, have the same name.

Table 1-10 Installed Services

Name	ID	Name of Parent Service	Global Counter and Subscriber Counter
Default Service	0		Default Service*
Generic	1	Default Service	Default Service*

Name	ID	Name of Parent Service	Global Counter and Subscriber Counter
Generic TCP	2	Generic	Generic TCP
Generic UDP	3	Generic	Generic UDP
Generic IP	6	Generic	Generic IP
Generic Upload/Download	39	Generic	Generic Upload/Download
E-Mail	4	Default Service	E-Mail*
POP3	21	E-Mail	E-Mail*
SMTP	22	E-Mail	E-Mail*
IMAP	23	E-Mail	E-Mail*
Browsing	7	Default Service	Browsing*
HTTP	16	Browsing	Browsing*
HTTPS	17	Browsing	Browsing*
Newsgroups	8	Default Service	Newsgroups
P2P	9	Default Service	P2P
eDonkey/eMule	14	P2P	eDonkey/eMule
Kazaa	15	P2P	Kazaa
BitTorrent	24	P2P	BitTorrent
Commercial File Sharing	26	P2P	Commercial File Sharing
Winny	27	P2P	Winny
Gnutella	30	P2P	Gnutella
WinMX	31	P2P	WinMX
VoIP	12	Default Service	VoIP
MGCP	5	VoIP	MGCP
SIP	10	VoIP	SIP
H323	11	VoIP	H323
Vonage	13	VoIP	Vonage
Skype	25	VoIP	Skype
Skinny	35	VoIP	Skinny
DingoTel	36	VoIP	DingoTel
Yahoo Messenger VoIP	37	VoIP	Yahoo Messenger VoIP
ICQ VoIP	40	VoIP	ICQ VoIP
Instant Messaging	28	Default Service	Instant Messaging
Gaming	29	Default Service	Gaming
FTP	32	Default Service	FTP

Name	ID	Name of Parent Service	Global Counter and Subscriber Counter
Net Admin	33	Default Service	Net Admin
Streaming	34	Default Service	Streaming*
Streaming over HTTP	18	Streaming	Streaming*
RTSP	19	Streaming	Streaming*
MMS	20	Streaming	Streaming*
Tunneling	38	Default Service	Tunneling

Note An asterisk is appended to a service counter name whenever the counter applies to more than one service.

RDR Settings

SCE platforms generate and transmit Raw Data Records (RDRs) that contain a wide variety of information and statistics, depending on the configuration of the system.

Table 1-11 Default RDR Settings

RDR Family	RDR Name	State	Rate	Rate Limit	Notes
Usage	Link	ON	Every 5 minutes		
	Package	ON	Every 5 minutes		
	Subscriber	ON	Every 10 minutes	200 per second	
Transaction	Transaction	ON		100 per second	All services have the same relative weight.
Transaction Usage	Transaction Usage (TUR)	OFF			No threshold.
	Interim TUR	OFF			
	Media Flow	ON			
Quota	Breach	OFF			
	Remaining	OFF	Every 5 minutes	100 per second	
	Threshold	OFF			Generate RDR when balance goes below 10 MB.
	Restore Quota	OFF			Generated upon subscriber introduction.

RDR Family	RDR Name	State	Rate	Rate Limit	Notes
Log	Block	ON		20 per second	
Real-Time Subscriber	Real-Time Subscriber Usage	ON	Every 1 minutes	100 per second	Enable for each subscriber separately, using CLI.
Real-Time Signaling	Flow Signaling	OFF			
	Attack Signaling	OFF			
Malicious Traffic	Malicious Traffic	ON			

Rules

Rules are set of configurable instructions telling the application how to handle flows classified to a service.

The default service configuration contains a single rule for the default service. Until the user creates other rules, the default service rule applies to all traffic processed by the SCE platform.

The default service rule places no restrictions on traffic:

- Flows are routed through the default BWCs, which have unlimited BW.
- No quota limitations are applied to the flows.

System Mode

The default System Mode is Report Only, which means that the system is used for reporting but does not control traffic.

Raw Data Records: Formats and Field Contents

This chapter contains a list of the Raw Data Records (RDRs) produced by the SCE platform and a full description of the fields contained in each RDR.

The chapter also contains field-content information for those fields that are generated by Service Control components.

This chapter contains the following sections:

- [Raw Data Records Overview](#) 2-3
- [Universal RDR Fields](#) 2-3
- [Transaction RDR](#) 2-5
- [Transaction Usage RDR](#) 2-6
- [HTTP Transaction Usage RDR](#) 2-7

Raw Data Records Overview

RDRs are the collection of fields that are sent by the Service Control Engine (SCE) platforms to the Cisco Service Control Management Suite (SCMS) Collection Manager (CM).

Fields that are common to many of the RDRs are described in the next section, before the individual RDRs are described.

Universal RDR Fields

This section contains descriptions of fields that are common to many RDRs. The first two fields, SUBSCRIBER_ID and PACKAGE_ID, appear in almost all the RDRs. The other fields are listed in alphabetic order.

- SUBSCRIBER_ID—The subscriber identification string, introduced through the subscriber management interfaces. It may contain up to 40 characters. For unknown subscribers this field may contain an empty string.
- PACKAGE_ID—The ID of the Package assigned to the subscriber whose traffic is being reported. An assigned Package ID is an integer value between 0 and maximum_number_of_packages. The value maximum_number_of_packages is reserved for unknown subscribers.
- ACCESS_STRING—A Layer 7 property, extracted from the transaction. For possible values, see *String Fields* (on page 2-34).
- BREACH_STATE—This field indicates whether the subscriber's quota was breached.
 - 0—Not breached
 - 1—Breached
- CLIENT_IP—The IP address of the client side of the reported session. (The client side is defined as the initiator of the networking session.) The IP address is in a 32-bit binary format.
- CLIENT_PORT—For TCP/UDP-based sessions, the port number of the client side (initiator) of the networking session. For non-TCP/UDP sessions, this field has the value zero.
- CONFIGURED_DURATION—For periodic RDRs, the configured period, in seconds, between successive RDRs.
- END_TIME—Ending time stamp of this RDR. The field is in UNIX time_t format, which is the number of seconds since midnight of 1 January 1970.
- INFO_STRING—A Layer 7 property extracted from the transaction. For possible values, see *String Fields* (on page 2-34).
- INITIATING_SIDE—On which side of the SCE platform the initiator of the transaction resides.
 - 0—The subscriber side
 - 1—The network side
- PROTOCOL_ID—This field contains the unique ID of the protocol associated with the reported session.

**Note**

For port-based protocols (for example, TCP port 666 for DOOM) and IP-protocol-based protocols (for example, IP protocol 1 for ICMP), the `PROTOCOL_ID` will be the `TCP_GENERIC / UDP_GENERIC / IP_PROTOCOL` value, according to the specific base protocol of the transaction.

- `PROTOCOL_SIGNATURE`—This field contains the ID of the protocol signature associated with this session.
- `ZONE_ID`—This field contains the ID of the zone associated with this session.
- `FLAVOR_ID`—For protocol signatures that have flavors, this field contains the ID of the flavor associated with this session.
- `REPORT_TIME`—Ending time stamp of this RDR. The field is in UNIX `time_t` format, which is the number of seconds since midnight of 1 January 1970.
- `SERVER_IP`—Contains the destination IP address of the reported session. (The destination is defined as the server or the listener of the networking session.) The IP address is in a 32-bit binary format.
- `SERVER_PORT`—For TCP/UDP-based sessions, this field contains the destination port number of the networking session. For non-TCP/UDP sessions, this field contains the IP protocol number of the session flow.
- `SERVICE_ID`—This field indicates the service classification of the reported session. For example, in the Transaction RDR this field indicates which service was accessed, and in the Breaching RDR this field indicates which service was breached.
- `TIME_FRAME`—The system supports time-dependent policies, by using different rules for different time frames. This field indicates the time frame during which the RDR was generated. The field's value can be in the range 0 to 3, indicating which of the four time frames was used.

**Note**

All volumes in RDRs are reported in L3 bytes.

Transaction RDR

The TRANSACTION_RDR may be generated at the end of a session, according to a user-configurable sampling mechanism—configuring *number-of-transaction-RDRs-per-second* sets the number of Transaction RDRs generated per-second. This RDR is not generated for sessions that were blocked by a rule.

The RDR tag of the TRANSACTION_RDR is **0xf0f0f010 / 4042321936**.

The following table lists the RDR fields and their descriptions.

Table 2-1 Transaction RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
PROTOCOL_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
SKIPPED_SESSIONS	INT32	The number of unreported sessions since the previous RDR.
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
ACCESS_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
INFO_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
MILLISEC_DURATION	INT32	Duration, in milliseconds, of the transaction reported in this RDR.
TIME_FRAME	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
SESSION_UPSTREAM_VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated downstream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global counters.

Transaction Usage RDR

RDR Field Name	Type	Description
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
ZONE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLAVOR_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.

Transaction Usage RDR

The TRANSACTION_USAGE_RDR is generated at the end of a session, for all transactions on packages and services that are configured to generate such an RDR. This RDR is not generated for sessions that were blocked by a rule.

Note

By default, packages and services are *disabled* from generating this RDR.

Caution

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the TRANSACTION_USAGE_RDR is **0xf0f0f438 / 4042323000**.

The following table lists the RDR fields and their descriptions.

Table 2-2 Transaction Usage RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
PROTOCOL_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
SKIPPED_SESSIONS	INT32	Number of unreported sessions since the previous RDR.
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
ACCESS_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
INFO_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).

RDR Field Name	Type	Description
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
MILLISEC_DURATION	UINT32	Duration, in milliseconds, of the transaction reported in this RDR.
TIME_FRAME	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
SESSION_UPSTREAM_VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated stream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global counters.
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
ZONE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLAVOR_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.

HTTP Transaction Usage RDR

The HTTP_TRANSACTION_USAGE_RDR is generated at the end of an HTTP session, for all transactions on packages and services that are configured to generate a Transaction Usage RDR. This RDR is not generated for sessions that were blocked by a rule.

Note

By default, packages and services are *disabled* from generating this RDR.

**Caution**

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the HTTP_TRANSACTION_USAGE_RDR is **0xf0f0f43C / 4042323004**.

The following table lists the RDR fields and their descriptions.

Table 2-3 HTTP Transaction Usage RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
PROTOCOL_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
SKIPPED_SESSIONS	INT32	Number of unreported sessions since the previous RDR.
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
ACCESS_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
INFO_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
MILLISEC_DURATION	UINT32	Duration, in milliseconds, of the transaction reported in this RDR.
TIME_FRAME	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
SESSION_UPSTREAM_VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated stream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global counters.

RDR Field Name	Type	Description
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
ZONE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLAVOR_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.
USER_AGENT	STRING	The user agent field extracted from the HTTP transaction.
HTTP_URL	STRING	The URL extracted from the HTTP transaction.

RTSP Transaction Usage RDR

The RTSP_TRANSACTION_USAGE_RDR is generated at the end of a session, for all RTSP transactions on packages and services that are configured to generate a Transaction Usage RDR. This RDR is not generated for sessions that were blocked by a rule.

Note

By default, packages and services are *disabled* from generating this RDR.

Caution

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the RTSP_TRANSACTION_USAGE_RDR is **0xf0f0f440 / 4042323008**.

The following table lists the RDR fields and their descriptions.

Table 2-4 RTSP Transaction Usage RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
PROTOCOL_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
SKIPPED_SESSIONS	INT32	Number of unreported sessions since the previous RDR.
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).

RTSP Transaction Usage RDR

RDR Field Name	Type	Description
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
ACCESS_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
INFO_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
MILLISEC_DURATION	UINT32	Duration, in milliseconds, of the transaction reported in this RDR.
TIME_FRAME	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
SESSION_UPSTREAM_VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated stream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global counters.
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
ZONE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLAVOR_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.
RTSP_SESSION_ID	STRING	RTSP session ID as seen on an RTSP SETUP request.
RTSP_URL	STRING	RTSP URL.
RESPONSE_DATE	STRING	RTSP DESCRIBE date.
TOTAL_ENCODING_RATE	UINT32	Sum of encoding rates of data flows.
NUMBER_OF_VIDEO_STREAMS	UINT8	Number of video streams for this RTSP session.
NUMBER_OF_AUDIO_STREAMS	UINT8	Number of audio streams for this RTSP session.
SESSION_TITLE	STRING	Title for this RTSP stream.
SERVER_NAME	STRING	Name of the RTSP server.

VoIP Transaction Usage RDR

The VOIP_TRANSACTION_USAGE_RDR is generated at the end of a session, for all transactions on packages and services that are configured to generate such an RDR. This RDR is not generated for sessions that were blocked by a rule.

Note

By default, packages and services are *disabled* from generating this RDR.

The VoIP Transaction Usage RDR is enabled automatically when the Transaction Usage RDR is enabled; both RDRs will be generated when the session ends. Currently, the VoIP Transaction Usage RDR is generated for H323, Skinny, SIP, and MGCP sessions.

Caution

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the VOIP_TRANSACTION_USAGE_RDR is **0xf0f0f46a / 4042323050**.

The following table lists the RDR fields and their descriptions.

Table 2-5 VoIP Transaction RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
PROTOCOL_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
SKIPPED_SESSIONS	INT32	Number of unreported sessions since the previous RDR
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
ACCESS_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
INFO_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
MILLISEC_DURATION	UINT32	Duration, in milliseconds, of the transaction reported in this RDR.
TIME_FRAME	INT8	See <i>Universal RDR Fields</i> (on page 2-3).

VoIP Transaction Usage RDR

RDR Field Name	Type	Description
SESSION_UPSTREAM_VOLUME	UINT32	Upstream volume of the transaction, in bytes. The volume refers to the aggregated upstream volume on both links of all the flows bundled in the transaction.
SESSION_DOWNSTREAM_VOLUME	UINT32	Downstream volume of the transaction, in bytes. The volume refers to the aggregated downstream volume on both links of all the flows bundled in the transaction.
SUBSCRIBER_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 subscriber counters.
GLOBAL_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global counters.
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package counters.
IP_PROTOCOL	UINT8	IP protocol type.
PROTOCOL_SIGNATURE	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
ZONE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLAVOR_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
FLOW_CLOSE_MODE	UINT8	The reason for the end of flow.
APPLICATION_ID	UINT32	The ITU-U vendor ID of the application. A value of 0xFFFFFFFF indicates that this field was not found in the traffic.
UPSTREAM_PACKET_LOSS	UINT16	The average fractional upstream packet loss for the session, taken from the RTCP flow. (Refer to the note following this table for an explanation of this value.) A value of 0xFFFF indicates that this field is undefined (no RTCP flows were opened).
DOWNSTREAM_PACKET_LOSS	UINT16	The average fractional downstream packet loss for the session, taken from the RTCP flow. (Refer to the note following this table for an explanation of this value.) A value of 0xFFFF indicates that this field is undefined (no RTCP flows were opened).
UPSTREAM_AVERAGE_JITTER	UINT32	The average upstream jitter for the session in units of 1/65 millisecond, taken from the RTCP flow. (Refer to the note following this table for an explanation of this value.) A value of 0xFFFFFFFF indicates that this field is undefined (no RTCP flows were opened).
DOWNSTREAM_AVERAGE_JITTER	UINT32	The average downstream jitter for the session in units of 1/65 millisecond, taken from the RTCP flow. (Refer to the note following this table for an explanation of this value.) A value of 0xFFFFFFFF indicates that this field is undefined (no RTCP flows were opened).

RDR Field Name	Type	Description
CALL_DESTINATION	STRING	The Q931 Alias address of the session destination. A value of N/A indicates that this field was not found in the traffic.
CALL_SOURCE	STRING	The Q931 Alias address of the session source. A value of N/A indicates that this field was not found in the traffic.
UPSTREAM_PAYLOAD_TYPE	UINT8	The upstream RTP payload type for the session. A value of 0xFF indicates that this field was not available (no RTP flows were opened).
DOWNSTREAM_PAYLOAD_TYPE	UINT8	The downstream RTP payload type for the session. A value of 0xFF indicates that this field is undefined (no RTP flows were opened).
CALL_TYPE	UINT8	The call type (taken from H225 packet). A value of 0xFF indicates that this field is undefined (no RTP flows were opened).
MEDIA_CHANNELS	UINT8	The number of data flows that were opened during the session.

**Note****Packet Loss**

This field is taken from the RTCP field “fraction lost”. It is the average value of all RTCP packets seen during the flow life for the specified direction. The value is the numerator of a fraction whose denominator is 256. To get the packet loss value as percentage, divide this value by 2.56.

Average Jitter

This field is taken from the RTCP field “interval jitter”. The reported value is the average value of all RTCP packets seen during the flow life for the specified direction. This value is multiplied by the NTP time-stamp delta (middle 32 bits) and divided by the RTCP time-stamp delta to convert it to normal time units. These two time stamps are also taken from the RTCP packet. The reported value is the average jitter in units of 1/65536 second. To convert to milliseconds divide by 65.536.

See RFC 1889 for further information about the RCP/RTCP standard.

Subscriber Usage RDR

The SUBSCRIBER_USAGE_RDR is generated periodically, at user-configured intervals, if the subscriber consumed resources associated with the service during the current reporting period.

At fixed, user-configurable intervals (for example, every 30 minutes), there is a periodic SUBSCRIBER_USAGE_RDR generation point. Whether or not a Subscriber Usage RDR *for a particular subscriber* is actually generated depends on the following:

- If the subscriber consumed resources associated with the service since the previous RDR generation point, a Subscriber Usage RDR is generated.
- If the subscriber did *not* consume resources associated with the service since the previous RDR generation point, *no* Subscriber Usage RDR is generated now.

**Note**

Unlike other Usage RDRs, the generation logic for Subscriber Usage RDRs does NOT use the *zeroing methodology* (as described in *Periodic RDR Zero Adjustment Mechanism* (on page 2-38)).

A Subscriber Usage RDR may also be generated in the following situation:

- The subscriber performed a logout in a subscriber-integrated installation or was un-introduced from the SCE platform. If the subscriber consumed resources associated with the service since the previous Subscriber Usage RDR, a Subscriber Usage RDR is generated now. If the subscriber did not consume resources since the previous RDR, no RDR is generated for that service.

The RDR tag of the SUBSCRIBER_USAGE_RDR is **0xf0f0f000 / 4042321920**.

The following table lists the RDR fields and their descriptions.

Table 2-6 Subscriber Usage RDR

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_USAGE_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 counters in the subscriber scope.
BREACH_STATE	UINT8	See <i>Universal RDR Fields</i> (on page 2-3). Holds the breach state of a service. However, this RDR reports usage counters, which cannot be breached, so the value is always zero.
REASON	UINT8	Reason for RDR generation: <ul style="list-style-type: none"> • 0—Period time passed • 1—Subscriber logout • 2—Package switch • 3—Wraparound • 4—End of aggregation period
CONFIGURED_DURATION	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
DURATION	INT32	This release—Not implemented (always the same as CONFIGURED_DURATION). Future release—Indicates the number of seconds that have passed since the previous SUBSCRIBER_USAGE_RDR.
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
UPSTREAM_VOLUME	INT32	Aggregated upstream volume on both links of all sessions, in kilobytes, for the current reporting period.
DOWNSTREAM_VOLUME	INT32	Aggregated downstream volume on both links of all sessions, in kilobytes, for the current reporting period.

RDR Field Name	Type	Description
SESSIONS	UINT16	Aggregated number of sessions for the reported service, for the current reporting period.
SECONDS	UINT16	Aggregated number of session seconds for the reported service, for the current reporting period.

Real-Time Subscriber Usage RDR

The `REALTIME_SUBSCRIBER_USAGE_RDR` is generated periodically, at user-configured intervals, if the subscriber consumed resources associated with the service during the current reporting period.

Note

A Real-Time Subscriber Usage RDR will be generated only for those subscribers with real-time monitoring enabled. For information about enabling real-time monitoring, see the “Additional Management Tools and Interfaces” chapter of the *Cisco Service Control Application for Broadband User Guide*.

At fixed, user-configurable intervals (for example, every 30 minutes), there is a periodic `REALTIME_SUBSCRIBER_USAGE_RDR` generation point. The `REALTIME_SUBSCRIBER_USAGE_RDR` reports the same usage information as the `SUBSCRIBER_USAGE_RDR`, but is generated more frequently to provide a more detailed picture of subscriber activity. It is used by the Cisco Service Control Application Reporter to generate reports on the activities of single subscribers over time.

Whether or not a Real-Time Subscriber Usage RDR *for a particular subscriber* is actually generated depends on the following:

- If the subscriber consumed resources associated with the service since the previous RDR generation point, a Real-Time Subscriber Usage RDR is generated.
- If the subscriber did *not* consume resources associated with the service since the previous RDR generation point, *no* Real-Time Subscriber Usage RDR is generated now.

However, the generation logic for Subscriber Usage RDRs uses the zeroing methodology (as described in *Periodic RDR Zero Adjustment Mechanism* (on page 2-38)); if the subscriber consumes resources associated with the service at some later time, this will cause the *immediate* generation of either one or two zero-consumption Real-Time Subscriber Usage RDRs. (In addition to the eventual generation of the Real-Time Subscriber Usage RDR associated with this latest consumption of resources).

- If there was only one interval (for example, 0805–0810) for which there was no subscriber consumption of resources, only one zero-consumption Real-Time Subscriber Usage RDR is generated.
- If there were multiple consecutive intervals (for example, 0805–0810, 0810–0815, 0815–0820, 0820–0825) for which there was no subscriber consumption of resources, two zero-consumption Real-Time Subscriber Usage RDRs are generated: one for the first such time interval (0805–0810) and one for the last (0820–0825).

Real-Time Subscriber Usage RDRs may also be generated in the following situation:

- The subscriber performed a logout in a subscriber-integrated installation or was un-introduced from the SCE platform:
 - If the subscriber consumed resources associated with the service since the previous Real-Time Subscriber Usage RDR, a Real-Time Subscriber Usage RDR is generated and then a zero-consumption Real-Time Subscriber Usage RDR is generated.
 - If the subscriber did not consume resources since the previous RDR, no RDR is generated for that service.

A zero-consumption Real-Time Subscriber Usage RDR will also be generated for a subscriber in the following situation:

- The subscriber performed a login in a subscriber-integrated installation or was introduced from the SCE platform:
 - Before the first time Real-Time Subscriber Usage RDR is generated for this service for this subscriber, a zero-consumption Real-Time Subscriber Usage RDR is generated.

The RDR tag of the REALTIME_SUBSCRIBER_USAGE_RDR is **0xf0f0f002 / 4042321922**.

The following table lists the RDR fields and their descriptions.

Table 2-7 Real-Time Subscriber Usage RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_USAGE_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 32 counters in the subscriber scope.
AGGREGATION_OBJECT_ID	INT16	Externally assigned: <ul style="list-style-type: none"> • 0—Offline subscriber • 1—Online subscriber
BREACH_STATE	UINT8	See <i>Universal RDR Fields</i> (on page 2-3). Holds the breach state of a service. However, this RDR reports usage counters, which cannot be breached, so the value is always zero.
REASON	UINT8	Reason for RDR generation: <ul style="list-style-type: none"> • 0—Period time passed • 1—Subscriber logout • 2—Package switch • 3—Wraparound • 4—End of aggregation period
CONFIGURED_DURATION	INT32	See <i>Universal RDR Fields</i> (on page 2-3).

RDR Field Name	Type	Description
DURATION	INT32	This release—Not implemented (always the same as CONFIGURED_DURATION). Future release—Indicates the number of seconds that have passed since the previous SUBSCRIBER_USAGE_RDR.
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
UPSTREAM_VOLUME	INT32	Aggregated upstream volume on both links of all sessions, in kilobytes, for the current reporting period.
DOWNSTREAM_VOLUME	INT32	Aggregated downstream volume on both links of all sessions, in kilobytes, for the current reporting period.
SESSIONS	UINT16	Aggregated number of sessions for the reported service, for the current reporting period.
SECONDS	UINT16	Aggregated number of session seconds for the reported service, for the current reporting period.

Link Usage RDR

The LINK_USAGE_RDR is generated periodically, at user-configured intervals, if the subscriber consumed resources associated with the service during the current reporting period.

At fixed, user-configurable intervals (for example, every 30 minutes), there is a periodic LINK_USAGE_RDR generation point. Whether or not a Link Usage RDR is actually generated depends on the following:

- If network resources associated with the service were consumed since the previous RDR generation point, a Link Usage RDR is generated.
- If network resources associated with the service were *not* consumed since the previous RDR generation point, *no* Link Usage RDR is generated.

However, the generation logic for Link Usage RDRs uses the zeroing methodology (as described in *Periodic RDR Zero Adjustment Mechanism* (on page 2-38)); if network resources associated with the service are again consumed at some later time, this will cause the *immediate* generation of either one or two zero-consumption Link Usage RDRs. (In addition to the eventual generation of the Link Usage RDR associated with this latest consumption of network resources).

- If there was only one interval (for example, 0830–0900) for which there was no consumption of network resources, only one zero-consumption Link Usage RDR is generated.
- If there were multiple consecutive intervals (for example, 0830–0900, 0900–0930, 0930–1000, 1000–1030) for which there was no consumption of network resources, two zero-consumption Link Usage RDR are generated: one for the first such time interval (0830–0900) and one for the last (1000–1030).

**Note**

A *separate* RDR is generated for *each link* (on a single traffic processor) in the SCE platform, where each RDR represents the total traffic processed and analyzed by that processor. To compute the total traffic in any given time frame, take the sum of the RDRs of all the processors. (A traffic processor that did not process any traffic of a specific service will not generate the corresponding RDR.)

The RDR tag of the LINK_USAGE_RDR is **0xf0f0f005 / 4042321925**.

The following table lists the RDR fields and their descriptions.

Table 2-8 Link Usage RDR Fields

RDR Field Name	Type	Description
LINK_ID	INT8	A numeric value associated with the reported network link. Possible values are 0 and 1 (referring to physical links 1 and 2 respectively). For future use.
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR. Possible values are 0 to 3.
SERVICE_USAGE_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global counters.
CONFIGURED_DURATION	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
DURATION	INT32	This release—Not implemented (always the same as CONFIGURED_DURATION). Future release—Indicates the number of seconds that have passed since the previous SUBSCRIBER_USAGE_RDR.
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
UPSTREAM_VOLUME	INT32	Aggregated upstream volume of all sessions, in kilobytes, for the current reporting period.
DOWNSTREAM_VOLUME	INT32	Aggregated downstream volume of all sessions, in kilobytes, for the current reporting period.
SESSIONS	INT32	Aggregated number of sessions for the reported service, for the current reporting period.
SECONDS	INT32	Aggregated number of session seconds for the reported service, for the current reporting period.
CONCURRENT_SESSIONS	INT32	Concurrent number of sessions using the reported service at this point in time.
ACTIVE_SUBSCRIBERS	INT32	Concurrent number of subscribers using the reported service at this point in time.
TOTAL_ACTIVE_SUBSCRIBERS	INT32	Concurrent number of subscribers in the system at this point in time.

Package Usage RDR

The PACKAGE_USAGE_RDR aggregates network usage information for all subscribers to the same package.

At fixed, user-configurable intervals (for example, every 5 minutes), there is a periodic PACKAGE_USAGE_RDR generation point. Whether or not a Package Usage RDR is actually generated depends on the following:

- If network resources associated with the service were consumed by a subscriber of the Package since the previous RDR generation point, a Package Usage RDR is generated.
- If a subscriber of the Package has not consumed network resources associated with the service since the previous RDR generation point, *no* Package Usage RDR is generated.

However, the generation logic for Package Usage RDRs uses the zeroing methodology (as described in *Periodic RDR Zero Adjustment Mechanism* (on page 2-38)); if network resources associated with the service are again consumed by a subscriber of the Package at some later time, this will cause the *immediate* generation of either one or two zero-consumption Package Usage RDRs. (In addition to the eventual generation of the Package Usage RDR associated with this latest consumption of network resources by a subscriber of the Package).

- If there was only one interval (for example, 0805–0810) for which there was no consumption of network resources by a subscriber of the Package, only one zero-consumption Package Usage RDR is generated.
- If there were multiple consecutive intervals (for example, 0805–0810, 0810–0815, 0815–0820, 0820–0825) for which there was no consumption of network resources by a subscriber of the Package, two zero-consumption Package Usage RDR are generated: one for the first such time interval (0805–0810) and one for the last (0820–0825).

Note

Each traffic processor in the SCE platform generates a separate RDR, where each RDR represents the total traffic processed and analyzed by that processor. To compute the total traffic (for a package) in any given time frame, take the sum of the RDRs of all the processors. (A traffic processor that did not process any traffic of a specific service for a specific package will not generate the corresponding RDR.)

The RDR tag of the PACKAGE_USAGE_RDR is **0xf0f004 / 4042321924**.

The following table lists the RDR fields and their descriptions.

Table 2-9 Package Usage RDR Fields

RDR Field Name	Type	Description
PACKAGE_COUNTER_ID	UINT16	Each package is mapped to a counter. There are 1024 package counters.
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.
SERVICE_USAGE_COUNTER_ID	UINT16	Each service is mapped to a counter. There are 64 global counters.

RDR Field Name	Type	Description
CONFIGURED_DURATION	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
DURATION	INT32	This release—Not implemented (always the same as CONFIGURED_DURATION). Future release—Indicates the number of seconds that have passed since the previous SUBSCRIBER_USAGE_RDR.
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
UPSTREAM_VOLUME	INT32	Aggregated upstream volume on both links (for a single processor) of all sessions, in kilobytes, for the current reporting period.
DOWNSTREAM_VOLUME	INT32	Aggregated downstream volume on both links (for a single processor) of all sessions, in kilobytes, for the current reporting period.
SESSIONS	INT32	Aggregated number of sessions for the reported service, for the current reporting period.
SECONDS	INT32	Aggregated number of session seconds for the reported service, for the current reporting period.
CONCURRENT_SESSIONS	INT32	Concurrent number of sessions using the reported service in the reported package at this point in time.
ACTIVE_SUBSCRIBERS	INT32	Concurrent number of subscribers using the reported service in the reported package at this point in time.
TOTAL_ACTIVE_SUBSCRIBERS	INT32	Concurrent number of subscribers in the system at this point in time.

Blocking RDR

The SERVICE_BLOCK_RDR is generated each time a transaction is blocked, and the profile and the rate/quota limitations indicate that this RDR should be generated.

Note the following regarding RDR generation:

- This RDR is generated when a session is blocked. A session may be blocked for various reasons; for example, access is blocked or concurrent session limit is reached.
- Generation of this RDR is subject to two limitations:
 - Quota—The maximum number of Blocking RDRs that *SCA BB* can generate for a subscriber in a specific aggregation period (day, week, month, and so forth). The quota is package-dependent; its value is set according to the package assigned to the subscriber.
 - Rate—The global, maximum number of Blocking RDRs that an SCE platform can generate per second. The rate is a global value that sets an upper limit for the total number of RDRs that are generated for all subscribers.

The RDR tag of the SERVICE_BLOCK_RDR is **0xf0f0f040 / 4042321984**.

The following table lists the RDR fields and their descriptions.

Table 2-10 Blocking RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
PROTOCOL_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
ACCESS_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
INFO_STRING	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
BLOCK_REASON	UINT8	Indicates the reason why this session was blocked. See <i>Block Reason (uint8)</i> (on page 2-34) for possible values and their interpretation.
BLOCK_RDR_COUNT	INT32	Total number of blocked flows reported so far (from the beginning of the current time frame).
REDIRECTED	INT8	Indicates whether the flow has been redirected after being blocked. <ul style="list-style-type: none"> • 0—Not redirected • 1—Redirected Redirection is performed only for HTTP and RTSP flows that were mapped to a rule ordering them to be blocked and redirected.
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).

Quota Breach RDR

The QUOTA_BREACH_RDR is generated each time a bucket is breached for the first time in a session.

This RDR does not have a rate limit; it is generated whenever a quota breach occurs, provided that the RDR is enabled.

This RDR is generated subject to the following conditions:

- One of the Subscriber's buckets was depleted.
- Quota Breach RDRs are enabled.

Remaining Quota RDR

- This is the first time this subscriber has breached this bucket.

The RDR tag of the QUOTA_BREACH_RDR is **0xf0f0f022 / 4042321954**.

The following table lists the RDR fields and their descriptions.

Table 2-11 Quota Breach RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
BUCKET_ID	UINT8	1 to 16, according to the number of the breached bucket.
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
BUCKET_QUOTA	INT32	The remaining quota in the indicated bucket: <ul style="list-style-type: none"> • Volume bucket—Kilobytes • Number of sessions bucket—Integer
AGGREGATION_PERIOD_TYPE	UINT8	Defines how often the bucket is refilled. See <i>Aggregation period (uint8)</i> (on page 2-36) for possible values and their interpretations.

Remaining Quota RDR

The REMAINING_QUOTA_RDR is generated periodically, at user-configured intervals, if the RDR is enabled.

Note

A Remaining Quota RDR will be generated only for those subscribers **whose policy requires the generation of such an RDR**

At fixed, user-configurable intervals (for example, every 30 minutes), there is a periodic REMAINING_QUOTA_RDR generation point. If REMAINING_QUOTA_RDRs are enabled, they will be generated at the specified times.

The user can set total limit enforcement on the number of these RDRs that are generated per second.

This RDR is also generated after a subscriber performs a logout in a subscriber-integrated installation or is un-introduced from the SCE platform, or when the subscriber's package-ID is changed.

The RDR tag of the REMAINING_QUOTA_RDR is **0xf0f0f030 / 4042321968**.

The following table lists the RDR fields and descriptions.

Table 2-12 Remaining Quota RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
RDR_REASON	UINT8	<ul style="list-style-type: none"> • 0—Period time passed • 1—Logout • 2—Package switch • 3—Wraparound • 4—End of aggregation period
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
REMAINING_QUOTA_1 through REMAINING_QUOTA_16	INT32	<p>The remaining quota in the bucket that was breached, in kilobytes.</p> <p>There are sixteen Remaining Quota fields, one for each bucket.</p>
TOTAL_VOLUME_USAGE	UINT32	Total Volume Usage for all services that are not quota provisioned, in kilobytes, for the current reporting period.

Quota Threshold Breach RDR

The QUOTA_THRESHOLD_BREACH_RDR is generated each time a bucket exceeds the global threshold.

This RDR does not have a rate limit; it is generated whenever a threshold is exceeded, provided that the RDR is enabled.

The RDR tag of the QUOTA_THRESHOLD_BREACH_RDR is **0xf0f0f031 / 4042321969**.

The following table lists the RDR fields and their descriptions.

Table 2-13 Quota Threshold Breach RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
BUCKET_ID	UINT8	1 to 16, according to the number of the breached bucket.
GLOBAL_THRESHOLD	UINT32	The globally configured threshold in kilobytes.
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
BUCKET_QUOTA	INT32	The remaining quota in the indicated bucket in kilobytes.

Quota State Restore RDRs

The QUOTA_STATE_RESTORE_RDR is generated each time a subscriber is introduced.

The RDR tag of the QUOTA_STATE_RESTORE_RDR is **0xF0F0F032 / 4042321970**.

The following table lists the RDR fields and their descriptions.

Table 2-14 Quota Threshold Breach RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
RDR_REASON	UINT8	The reason the RDR was sent: <ul style="list-style-type: none"> 0—Subscriber introduced (currently, the only available value)
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).

DHCP RDR

The DHCP_RDR is generated each time a DHCP message of a specified type is intercepted.

Note

DHCP RDRs are generated only if activated by a subscriber integration system, such as the SCMS Subscriber Manager (SM) DHCP LEG.

For each message read, the *Service Control Application for Broadband (SCA BB)* extracts several option fields. You can configure which fields to extract. An RDR will be generated even if none of the fields were found.

The RDR tag of the DHCP_RDR is **0xf0f0f042 / 4042321986**

The following table lists the RDR fields and descriptions.

Table 2-15 DHCP RDR Fields

RDR Field Name	Type	Description
CPE_MAC	STRING	A DHCP protocol field.
CMTS_IP	UINT32	A DHCP protocol field.
ASSIGNED_IP	UINT32	A DHCP protocol field.
RELEASED_IP	UINT32	A DHCP protocol field.
TRANSACTION_ID	UINT32	A DHCP protocol field.
MESSAGE_TYPE	UINT8	DHCP message type.
OPTION_TYPE_0 through OPTION_TYPE_7	UINT8	A list of DHCP options extracted from the message.
OPTION_VALUE_0 through OPTION_VALUE_7	STRING	The values associated with the above DHCP options.
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).

RADIUS RDR

The RADIUS_RDR is generated each time a RADIUS message of a specified type is intercepted.

Note

RADIUS RDRs are generated only if activated by a subscriber integration system, such as the SCMS-SM RADIUS LEG.

For each message read, *SCA BB* extracts several option fields. You can configure which fields to extract. An RDR will be generated even if none of the fields were found.

The RDR tag of the RADIUS_RDR is **0xf0f0f043 / 4042321987**

The following table lists the RDR fields and descriptions.

Table 2-16 RADIUS RDR Fields

RDR Field Name	Type	Description
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
RADIUS_PACKET_CODE	UINT8	The type of the RADIUS message intercepted.
RADIUS_ID	UINT8	The RADIUS transaction ID.
ATTRIBUTE_VALUE_1 through ATTRIBUTE_VALUE_20	STRING	Attributes extracted from the message. Sent as string format TLV. The last attribute field filled takes the value 0.

Flow Start RDR

The FLOW_START_RDR is generated when a flow starts, for any flow on packages and services that are configured to generate such an RDR.

Caution

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the FLOW_START_RDR is **0xf0f0f016 / 4042321942**.

The following table lists the RDR fields and their descriptions.

Table 2-17 Flow Start RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
IP_PROTOCOL	UINT8	IP protocol type.
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).

RDR Field Name	Type	Description
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
START_TIME	UINT32	Flow start time.
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
BREACH_STATE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
FLOW ID	UINT32	Internal flow ID.
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.

Flow End RDR

The FLOW_END_RDR is generated when a flow stops, for any flow that generated a FLOW_START_RDR.

Caution

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the FLOW_END_RDR is **0xf0f0f018 / 4042321944**.

The following table lists the RDR fields and their descriptions.

Table 2-18 Flow End RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
IP_PROTOCOL	UINT8	IP protocol type.
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).

RDR Field Name	Type	Description
START_TIME	UINT32	Flow start time.
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
BREACH_STATE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
FLOW ID	UINT32	Internal flow ID.
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.

Ongoing Flow RDR

The FLOW_ONGOING_RDR is generated at set time intervals during the life of a flow, for any flow that generated a FLOW_START_RDR, if the system is configured to issue such RDR.

Caution

This RDR is designed for services and packages where specific, per-transaction RDRs are required (for example, transaction level billing). It is easy to configure this RDR, in error, so that it is generated for every transaction, which may result in an excessive RDR rate. *Configure the generation scheme for this RDR with extra care.*

The RDR tag of the FLOW_ONGOING_RDR is **0xf0f0f017 / 4042321943**.

The following table lists the RDR fields and their descriptions.

Table 2-19 Ongoing Flow RDR Fields

RDR Field Name	Type	Description
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
IP_PROTOCOL	UINT8	IP protocol type.
SERVER_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
SERVER_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_IP	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
CLIENT_PORT	UINT16	See <i>Universal RDR Fields</i> (on page 2-3).
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
START_TIME	UINT32	Flow start time.
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
BREACH_STATE	INT8	See <i>Universal RDR Fields</i> (on page 2-3).
FLOW ID	UINT32	Internal flow ID.

RDR Field Name	Type	Description
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.

Media Flow RDR

The MEDIA_FLOW_RDR is generated at the end of every SIP or Skype media flow:

- For SIP, this RDR is generated when a media channel is closed.
- For Skype, this RDR is generated when an end-of-call is detected.

Note SIP includes all SIP based applications (such as Vonage and Yahoo Messenger VoIP).

The RDR tag of the MEDIA_FLOW_RDR is **0xF0F0F46C / 4042323052**.

The following table lists the RDR fields and their descriptions.

Table 2-20 Media Flow RDR Fields

Field name	Type	Description
SUBSCRIBER_ID	String	See <i>Universal RDR Fields</i> (on page 2-3).
PACKAGE_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
SERVICE_ID	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
PROTOCOL_ID	INT16	See <i>Universal RDR Fields</i> (on page 2-3).
DESTINATION_IP	UINT32	SIP: Destination IP of RTP flow. Skype: Destination IP of Skype flow.
DESTINATION_PORT	UINT16	SIP: Destination port of RTP flow. Skype: Destination port of Skype flow.
SOURCE_IP	UINT32	SIP: Source IP of RTP flow. Skype: Source IP of Skype flow.
SOURCE_PORT	UINT16	SIP: Source port of RTP flow. Skype: Source port of Skype flow.
INITIATING_SIDE	INT8	See <i>Universal RDR Fields</i> (on page 2-3). For Skype, this is the initiating side of the flow (not necessarily the initiating side of the voice call).
ZONE_ID	Int32	See <i>Universal RDR Fields</i> (on page 2-3).
FLAVOR_ID	Int32	See <i>Universal RDR Fields</i> (on page 2-3).
SIP_DOMAIN	String	SIP: Domain name extracted from SIP header.
SIP_USER_AGENT	String	SIP: User-Agent field extracted from SIP header.

Field name	Type	Description
START_TIME	UINT32	Flow start time.
REPORT_TIME	UINT32	See <i>Universal RDR Fields</i> (on page 2-3).
DURATION_SECONDS	INT32	SIP: The active duration of the RTP flow, <i>not</i> including aging time. Skype: The time between the start-of-call and end-of-call detection events.
UPSTREAM_VOLUME	UINT32	SIP: The upstream volume of the RTP flow. Skype: The upstream volume between the start-of-call and end-of-call detection events.
DOWNSTREAM_VOLUME	UINT32	SIP: The downstream volume of the RTP flow. Skype: The downstream volume between the start-of-call and end-of-call detection events.
IP_PROTOCOL	UINT8	IP protocol type: <ul style="list-style-type: none"> • 6—TCP • 17—UDP
FLOW_TYPE	INT8	<ul style="list-style-type: none"> • 0—All Skype flows • 1—Audio (SIP) • 2—Video (SIP)
SESSION_ID	UINT32	SIP: The flow-context ID of the control flow. Skype: The flow-context ID of the flow.
UPSTREAM_JITTER	UINT32	SIP: The average upstream jitter for the session, taken from the RTCP flow: N/A (0xFFFFFFFF) if RTCP flow is missing. Skype: N/A (0xFFFFFFFF).
DOWNSTREAM_JITTER	UINT32	SIP: The average downstream jitter for the session, taken from the RTCP flow: N/A (0xFFFFFFFF) if RTCP flow is missing. Skype: N/A (0xFFFFFFFF).
UPSTREAM_PACKET_LOSS	UINT16	SIP: The average fractional upstream packet loss for the session, taken from the RTCP flow: N/A (0xFFFF) if RTCP flow is missing. Skype: N/A (0xFFFF).
DOWNSTREAM_PACKET_LOSS	UINT16	SIP: The average fractional downstream packet loss for the session, taken from the RTCP flow: N/A (0xFFFF) if RTCP flow is missing. Skype: N/A (0xFFFF).
UPSTREAM_PAYLOAD_TYPE	UINT8	SIP: The upstream RTP payload type for the session. Skype: N/A (0xFF).

Field name	Type	Description
DOWNSTREAM_PAYLOAD_TYPE	UINT8	SIP: The downstream RTP payload type for the session. Skype: N/A (0xFF).

**Note****Packet Loss**

This field is taken from the RTCP field “fraction lost”. It is the average value of all RTCP packets seen during the flow life for the specified direction. The value is the numerator of a fraction whose denominator is 256. To get the packet loss value as percentage, divide this value by 2.56.

Average Jitter

This field is taken from the RTCP field “interval jitter”. The reported value is the average value of all RTCP packets seen during the flow life for the specified direction. This value is multiplied by the NTP time-stamp delta (middle 32 bits) and divided by the RTCP time-stamp delta to convert it to normal time units. These two time stamps are also taken from the RTCP packet. The reported value is the average jitter in units of 1/65536 second. To convert to milliseconds divide by 65.536.

See RFC 1889 for further information about the RCP/RTCP standard.

Attack Start RDR

The ATTACK_START_RDR is generated at the beginning of an attack for all attack types that are configured to generate such an RDR. (To enable and configure the generation of these RDRs, see “The Service Security Dashboard” in the “Using the Service Configuration Editor: Additional Options” chapter of the *Cisco Service Control Application for Broadband User Guide*.)

The RDR tag of the ATTACK_START_RDR is **0xf0f0f019 / 4042321945**.

The following table lists the RDR fields and their descriptions.

Table 2-21 Attack Start RDR Fields

RDR Field Name	Type	Description
ATTACK_ID	UINT32	Unique attack ID.
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
ATTACKING_IP	UINT32	The IP address related to the attack (for example: in a DDoS, this will be the IP address under attack; in a scan this will be the IP address of the source of the scan).
ATTACKED_IP	UINT32	The other IP address related to the attack, if one exists; otherwise, 0xFFFFFFFF.
ATTACKED_PORT	UINT16	Attacked port: 0xFFFF if not present.
ATTACKING_SIDE	INT8	On which side of the SCE ATTACKING_IP resides: <ul style="list-style-type: none"> • 0—Subscriber • 1—Network
IP_PROTOCOL	UINT8	IP protocol type.

RDR Field Name	Type	Description
ATTACK_TYPE	UINT32	To whom ATTACKING_IP belongs: <ul style="list-style-type: none"> • 0—Attacked • 1—Attacker
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.
ATTACK_TIME	UINT32	Time since attack started in seconds.
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).

Attack End RDR

The ATTACK_END_RDR is generated at the end of an attack for any attack that caused the generation of an ATTACK_START_RDR.

The RDR tag of the ATTACK_END_RDR is **0xf0f0f01a / 4042321946**.

The following table lists the RDR fields and their descriptions.

Table 2-22 Attack End RDR Fields

RDR Field Name	Type	Description
ATTACK_ID	UINT32	Unique attack ID.
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
ATTACKING_IP	UINT32	The IP address related to the attack (for example: in a DDoS, this will be the IP address under attack; in a scan this will be the IP address of the source of the scan).
ATTACKED_IP	UINT32	The other IP address related to the attack, if one exists; otherwise, 0xFFFFFFFF.
ATTACKED_PORT	UINT16	Attacked port: 0xFFFF if not present.
ATTACKING_SIDE	INT8	On which side of the SCE ATTACKING_IP resides: <ul style="list-style-type: none"> • 0—Subscriber • 1—Network
IP_PROTOCOL	UINT8	IP protocol type.
ATTACK_TYPE	UINT32	To whom ATTACKING_IP belongs: <ul style="list-style-type: none"> • 0—Attacked • 1—Attacker
GENERATOR_ID	INT8	A numeric value identifying the processor generating the RDR.
ATTACK_TIME	UINT32	Time since attack started in seconds.
REPORT_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).

Malicious Traffic Periodic RDR

The MALICIOUS_TRAFFIC_PERIODIC_RDR is generated when an attack is detected. A MALICIOUS_TRAFFIC_PERIODIC_RDR is then generated periodically, at user-configured intervals, for the duration of the attack. The MALICIOUS_TRAFFIC_PERIODIC_RDR reports the details of the attack or malicious traffic.

After the attack ends, a report of the resources consumed since the start of the attack is sent.

The RDR tag of the MALICIOUS_TRAFFIC_PERIODIC_RDR is **0xf0f0f050 / 4042322000**.

The following table lists the RDR fields and their descriptions.

Table 2-23 Malicious Traffic Periodic RDR Fields

RDR Field Name	Type	Description
ATTACK_ID	INT32	Unique attack ID.
SUBSCRIBER_ID	STRING	See <i>Universal RDR Fields</i> (on page 2-3).
ATTACK_IP	UINT32	The IP address related to this attack.
OTHER_IP	UINT32	The other IP address related to this attack, if such exists (if this is a DOS attack), or -1 otherwise.
PORT_NUMBER	UINT16	The port number related to this attack, if such exists (if this is an IP scan, for example), or -1 otherwise.
ATTACK_TYPE	INT32	Who ATTACK_IP belongs to: <ul style="list-style-type: none"> • 0—Attacked • 1—Attacker
SIDE	INT8	The IP address side: <ul style="list-style-type: none"> • 0—Subscriber • 1—Network
IP_PROTOCOL	UINT8	IP protocol type: <ul style="list-style-type: none"> • 0—Other • 1—ICMP • 6—TCP • 17—UDP
CONFIGURED_DURATION	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
DURATION	INT32	Indicates the number of seconds that have passed since the previous MALICIOUS_TRAFFIC_RDR.
END_TIME	INT32	See <i>Universal RDR Fields</i> (on page 2-3).
ATTACKS	INT8	The number of attacks in the current reporting period. Since this report is generated per attack, the value is 0 or 1.

RDR Enumeration Fields

RDR Field Name	Type	Description
MALICIOUS_SESSIONS	INT32	Aggregated number of sessions for the reported attack, for the current reporting period. If the SCE platform blocks the attack, this field takes the value -1.

**Note**

You can identify the type of attack (scan, DDOS, or DOS) from Malicious Traffic Periodic RDR data:
 Scan—OTHER_IP=-1 and ATTACK_TYPE=1 (the RDR contains the source (attacker) IP address)
 DDOS attack—OTHER_IP=-1 and ATTACK_TYPE=0 (the RDR contains the destination (attacked) IP address)
 DOS attack—OTHER_IP contains an IP address (the RDR contains two IP addresses)

RDR Enumeration Fields

The following sections list possible values for the RDR enumeration fields.

Block Reason (uint8)

The BLOCK_REASON field is a bit field. The following table lists the meanings of the bits of this field.

Table 2-24 Block Reason Field Bit Values

Bits Number	Value and Description
7 (msb)	Always ON.
6	0—The action of the effective rule is <i>block</i> . 1—The concurrent session limit of the effective rule was reached.
5	0—The effective rule was in pre-breach state. 1—The effective rule was in post-breach state.
4 to 0 (lsb)	The number of the breached bucket (1 to 16).

String Fields

The following table lists the ACCESS_STRING and INFO_STRING field values.

Table 2-25 String Field Values

Name	TR ACCESS_STRING	TR INFO_STRING	Description
PROTOCOL_TCP_GENERIC	Null	Null	
PROTOCOL_UDP_GENERIC	Null	Null	
PROTOCOL_HTTP_BROWSING	Host name	URL	

Name	TR ACCESS_STRING	TR INFO_STRING	Description
PROTOCOL_HTTP_STREAMING	Host name	URL	
PROTOCOL_FTP	Null	Null	
PROTOCOL_RTSP	Host name	Null	
PROTOCOL_MMS	Null	Null	
PROTOCOL_PROXY_HTTP	Host name	Null	
PROTOCOL_SMTTP	Server IP	Sender	
PROTOCOL_POP3	Server name	Login name	
PROTOCOL_IP_GENERIC	Null	Null	Non-TCP/UDP transaction
PROTOCOL_GNUTELLA_NETWORKING	Null	Null	Peer to peer
PROTOCOL_GNUTELLA_FILE_TRANSFER	Null	Null	Peer to peer
PROTOCOL_FASTTRACK_NETWORKING	Null	Null	Peer to peer
PROTOCOL_FASTTRACK_TRANSFER	Network name	Null	Peer to peer
PROTOCOL_NNTP	Null	Group name	
PROTOCOL_NAP_WINMX_TRANSFER	Null	Null	Peer to peer
PROTOCOL_WINNY	Null	Null	Peer to peer
PROTOCOL_EDONKEY	Null	Null	Peer to peer
PROTOCOL_DIRECT_CONNECT	Null	Null	Peer to peer
PROTOCOL_HOTLINE	Null	Null	Peer to peer
PROTOCOL_DYNAMIC_SIGNATURE	Null	Null	
PROTOCOL_MANOLITO	Null	Null	Peer to peer
PROTOCOL_SIP	SIP Method	SIP Domain	
PROTOCOL_BITTORRENT	Null	Null	Peer to peer
PROTOCOL_SKYPE	Null	Null	Peer to peer
PROTOCOL_VONAGE	SIP Method	SIP Subscriber ID	
PROTOCOL_SHARE	Null	Null	Peer to peer
PROTOCOL_H323	Null	Is FastStart	

Name	TR ACCESS_STRING	TR INFO_STRING	Description
PROTOCOL_SOULSEEK	Null	Null	Peer to peer
PROTOCOL_ITUNES	Null	Null	Peer to peer
PROTOCOL_FILETOPIA	Null	Null	Peer to peer
PROTOCOL_NAPSTER	Null	Null	Peer to peer
PROTOCOL_DHCP	Null	Null	
PROTOCOL_MUTE	Null	Null	Peer to peer
PROTOCOL_NODEZILLA	Null	Null	Peer to peer
PROTOCOL_WASTE	Null	Null	Peer to peer
PROTOCOL_NEONET	Null	Null	Peer to peer
PROTOCOL_MGCP	Null	Null	
PROTOCOL_WAREZ	Null	Null	Peer to peer

Aggregation Period (uint8)

The following table lists the AGG_PERIOD field values.

Table 2-26 AGG_PERIOD Field Values

Name	Value	Description
AGGREGATE_HOURLY	0	Hourly aggregate—Every hour, on the hour.
AGGREGATE_DAILY	1	Daily aggregate—Every day at midnight.
AGGREGATE_WEEKLY	2	Deprecated in 3.0.
AGGREGATE_MONTHLY	3	Deprecated in 3.0.
EXTERNAL_QUOTA_PROVISION	4	The quota is externally provisioned and managed by a third-party source.

Time Frames (uint16)

The following table lists the TIME_FRAME field values.

Table 2-27 Time Frame Field Values

Name	Value	Description
TIME_FRAME_0 through TIME_FRAME_3	0–3	ID of active time frame. A number from 0 to 3 that indicates the time frame internal index.

RDR Tag Assignment Summary

The following is a summary of RDR tag assignments.

You can configure the RDR categories using the SCE CLI. See the *Cisco Service Control Engine (SCE) CLI Command Reference* for more information.

Table 2-28 RDR Tag Assignments

RDR Name	Default Category (explained below)	Tag Value (decimal)	Tag Value (hexa)
SUBSCRIBER USAGE RDR (NUR)	CM-DB (1)	4,042,321,920	F0 F0 F0 00
REALTIME SUBSCRIBER USAGE RDR (SUR)	CM-DB (1)	4,042,321,922	F0 F0 F0 02
PACKAGE USAGE RDR	CM-DB (1)	4,042,321,924	F0 F0 F0 04
LINK USAGE RDR	CM-DB (1)	4,042,321,925	F0 F0 F0 05
TRANSACTION RDR	CM-DB (1)	4,042,321,936	F0 F0 F0 10
TRANSACTION USAGE RDR	CM-CSV (1)	4,042,323,000	F0 F0 F4 38
HTTP TRANSACTION USAGE RDR	CM-CSV (1)	4,042,323,004	F0 F0 F4 3C
RTSP TRANSACTION USAGE RDR	CM-CSV (1)	4,042,323,008	F0 F0 F4 40
VOIP TRANSACTION USAGE RDR	CM-CSV (1)	4,042,323,050	F0 F0 F4 6A
BLOCKING RDR	CM-CSV (1)	4,042,321,984	F0 F0 F0 40
QUOTA BREACH RDR	QP (4)	4,042,321,954	F0 F0 F0 22
REMAINING QUOTA RDR	QP (4)	4,042,321,968	F0 F0 F0 30
QUOTA THRESHOLD RDR	QP (4)	4,042,321,969	F0 F0 F0 31
QUOTA STATE RESTORE RDR	QP (4)	4,042,321,970	F0 F0 F0 32
RADIUS RDR	SM (3)	4,042,321,987	F0 F0 F0 43
DHCP RDR	SM (3)	4,042,321,986	F0 F0 F0 42
FLOW START RDR	RT (2)	4,042,321,942	F0 F0 F0 16
FLOW END RDR	RT (2)	4,042,321,944	F0 F0 F0 18
MEDIA FLOW RDR	CM-DB (1)	4,042,323,052	F0 F0 F4 6C
FLOW ONGOING RDR	RT (2)	4,042,321,943	F0 F0 F0 17
ATTACK_START RDR	RT (2)	4,042,321,945	F0 F0 F0 19
ATTACK_END RDR	RT (2)	4,042,321,946	F0 F0 F0 1A
MALICIOUS TRAFFIC RDR	DC-DB (1)	4,042,322,000	F0 F0 F0 50

Table 2-29 RDR Tag Default Categories

Default Category	Intended Destination and Use
CM-DB (1)	The CM database. Used by the SCA Reporter to generate reports.
CM-CSV (1)	The CM. Stored as CSV files.
RT (2)	Other network devices. Typically used for functionality that requires a real-time response, such as QoS, provisioning, and deletion.
SM (3)	SM's DHCP and RADIUS legs.
QP (4)	External quota provisioning systems. Used as notifications of the SCE Subscribers API.

Periodic RDR Zero Adjustment Mechanism

The Periodic RDRs (or Network Usage RDRs) include the Link Usage, Package Usage, and Real-Time Subscriber Usage RDRs. When there is traffic for a particular service or package, the appropriate Usage RDRs are generated periodically, according to user-configured intervals. The RDR includes a time stamp of the end of the interval during which the traffic was recorded.

When there is *no* traffic (and therefore no consumed resources) for a particular service or package during a given period of time, the **SCA BB** application uses the Periodic RDR Zero Adjustment Mechanism, also called the *zeroing methodology*, to reduce the number of Usage RDRs generated for that service or package. This technique also simplifies collection for external systems by reducing the number of RDRs that they need to handle.

Note

Unlike other Usage RDRs, the generation logic for Subscriber Usage RDRs does NOT use the *zeroing methodology*.

The zeroing methodology algorithm works as follows: for any number of consecutive time intervals having no traffic for a particular service or package, zero-consumption RDRs are generated for the first and last zero-consumption time intervals, but not for the intermediate time intervals. These two zero-consumption RDRs are generated when the next traffic arrives.

EXAMPLE 1

The Real-Time Subscriber Usage RDR (for a given subscriber) has a generation period of 30 minutes. There is subscriber traffic during the interval 1200–1230, no subscriber traffic during the following five intervals (1230–1300, 1300–1330, 1330–1400, 1400–1430, 1430–1500), and the next subscriber traffic occurs at 1522. The following Real-Time Subscriber Usage RDRs are generated:

- At 1230, one RDR with the values of the consumed resources for the interval 1200–1230, and with the time stamp 1230.

- At 1522, one zero-consumption RDR having the time stamp (1300) of the end of the *first* interval (1230–1300) with no traffic for that subscriber.
 - At 1522, one zero-consumption RDR having the time stamp (1500) of the end of the *last* interval (1430–1500) with no traffic for that subscriber.
- No RDR is generated for the three intermediate zero-consumption intervals (1300–1330, 1330–1400, and 1400–1430).
- At 1530, one RDR with the values of the consumed resources for the interval 1500–1530, and with the time stamp 1530.

EXAMPLE 2

The Real-Time Subscriber Usage RDR (for a given subscriber) has a generation period of 30 minutes. There is subscriber traffic during the interval 1200–1230, no subscriber traffic during the following interval 1230–1300, and the next subscriber traffic occurs at 1322. The following Real-Time Subscriber Usage RDRs are generated:

- At 1230, one RDR with the values of the consumed resources for the interval 1200–1230, and with the time stamp 1230.
- At 1322, one zero-consumption RDR having the time stamp (1300) of the *single* interval (1230–1300) with no traffic for that subscriber.
- At 1330, one RDR with the values of the consumed resources for the interval 1300–1330, and with the time stamp 1330.

Database Tables: Formats and Field Contents

Each Raw Data Record (RDR) is sent to the Cisco Service Control Management Suite (SCMS) Collection Manager (CM). On the CM, adapters convert the RDRs and store them in database tables. There is a separate table for each RDR type. This chapter presents these tables and their columns (field names and types).

For additional information, such as RDR structure, RDR column and field descriptions, and how the RDRs are generated, see *Raw Data Records: Formats and Field Contents* (on page 2-1).

This chapter contains the following sections:

- [Database Tables Overview](#) 3-2
- [Table RPT_NUR](#) 3-2
- [Table RPT_SUR](#) 3-3
- [Table RPT_PUR](#) 3-3
- [Table RPT_LUR](#) 3-4
- [Table RPT_TR](#) 3-5
- [Table RPT_MEDIA](#) 3-6
- [Table RPT_MALUR](#) 3-7
- [Table RPT_TOPS_PERIOD0](#) 3-8
- [Table RPT_TOPS_PERIOD1](#) 3-9
- [Table INI_VALUES](#) 3-10
- [Table CONF_SE_TZ_OFFSET](#) 3-10

Database Tables Overview

Each RDR is routed to the appropriate adapter—the JDBC Adapter or the Topper/Aggregator (TA) Adapter—converted, and written into a database table row. There is a separate table for each RDR type, with a column designated for each RDR field.

In addition to the RDR fields that are specific to each RDR type, the tables RPT_NUR, RPT_SUR, RPT_PUR, RPT_LUR, and RPT_TR contain two universal columns: TIME_STAMP and RECORD_SOURCE. The following values are placed in these two universal columns (field numbers 1 and 2, respectively):

- TIME_STAMP—The RDR time stamp assigned by the SCMS-CM. The field is in UNIX time_t format, which is the number of seconds since midnight of 1 January 1970.
- RECORD_SOURCE—Contains the IP address of the Service Control Engine (SCE) platform that generated the RDR.

The IP address is in 32-bit binary format (displayed as a 4-byte integer).

Table RPT_NUR

Database table RPT_NUR stores data from SUBSCRIBER_USAGE_RDRs.

Note

This table is not part of the default configuration.

These RDRs have the tag **4042321920**.

Table 3-1 Columns for Table RPT_NUR

Field Name	Type
TIME_STAMP	DateTime
RECORD_SOURCE	Number
SUBSCRIBER_ID	String
PACKAGE_ID	Number
SUBS_USG_CNT_ID	Number
BREACH_STATE	Number
REASON	Number
CONFIGURED_DURATION	Number
DURATION	Number
END_TIME	Number
UPSTREAM_VOLUME	Number
DOWNSTREAM_VOLUME	Number
SESSIONS	Number

Field Name	Type
SECONDS	Number

Table RPT_SUR

Database table RPT_SUR stores data from REALTIME_SUBSCRIBER_USAGE_RDRs.

These RDRs have the tag **4042321922**.

Table 3-2 Columns for Table RPT_SUR

Field Name	Type
TIME_STAMP	DateTime
RECORD_SOURCE	Number
SUBSCRIBER_ID	String

END_TIME	Number
ATTACKS	Number
MALICIOUS_SESSIONS	Number

Table RPT_TOPS_PERIOD0

The Topper/Aggregator (TA) Adapter generates database table RPT_TOPS_PERIOD0 for its shorter aggregation interval (by default, one hour).

Table 3-8 Columns for Table RPT_TOPS_PERIOD0

Field Name	Type
RECORD_SOURCE	Number
METRIC_ID	Number
SUBS_USG_CNT_ID	Number
TIME_STAMP	DateTime
AGG_PERIOD	Number
SUBSCRIBER_ID	String
CONSUMPTION	Number

For each Top Report, the TA Adapter sorts the subscriber/consumption pairs from the highest consumption to lowest. At the end of each report is a statistic giving the sum of all subscribers for this metric.

If the report is empty, typically when no traffic was reported for the designated service/metric pair during the aggregation period, the DB will still be updated, but the only row in the report will be the final row showing a total consumption of zero. The DB is updated to avoid the perception in the Cisco Service Control Application (SCA) Reporter that the report is not there because of a malfunction.

The possible values for the field METRIC_ID are presented in the following table.

Table 3-9 Metric_ID Values

Metric_ID	Metric
0	Up Volume
1	Down Volume
2	Combined Volume
3	Sessions
4	Seconds

Table RPT_TOPS_PERIOD1

The Topper/Aggregator (TA) Adapter generates database table RPT_TOPS_PERIOD1 for its longer aggregation interval (by default, 24 hour).

Table 3-10 Columns for Table RPT_TOPS_PERIOD1

Field Name	Type
RECORD_SOURCE	Number
METRIC_ID	Number
SUBS_USG_CNT_ID	Number
TIME_STAMP	DateTime
AGG_PERIOD	Number
SUBSCRIBER_ID	String
CONSUMPTION	Number

For each Top Report, the TA Adapter sorts the subscriber/consumption pairs from the highest consumption to lowest. At the end of each report is a statistic giving the sum of all subscribers for this metric.

If the report is empty, typically when no traffic was reported for the designated service/metric pair during the aggregation period, the DB will still be updated, but the only row in the report will be the final row showing a total consumption of zero. The DB is updated to avoid the perception in the SCA Reporter that the report is not there because of a malfunction.

The possible values for the field METRIC_ID are presented in the following table.

Table 3-11 Metric_ID Values

Metric_ID	Metric
0	Up Volume
1	Down Volume
2	Combined Volume
3	Sessions
4	Seconds

Table INI_VALUES

Database table INI_VALUES is updated whenever the service configuration is applied to the SCE platform. This table contains, for each SCE IP address, mappings between numeric identifiers and textual representation for services, packages, and other service configuration components. The mapping is represented as a standard properties file in string form, where each mapping file is stored in one row. The SCA Reporter uses the mappings contained in this table.

Table 3-12 Columns for Table INI_VALUES

Field Name	Type	Description
TIME_STAMP	DateTime	
SE_IP	String	Identification of the SCE platform where these values were applied.
VALUE_TYPE	Number	Key/Value family type. The possible values are: 1—Service ID / service name 2—Package ID / package name 3—TCP port number / port name 4—Time frame ID / time frame name 5—SCE address 32-bit / dotted notation 6—IP protocol number / IP protocol name 7—Signature protocol ID / protocol name 8—P2P signature protocol ID / protocol name 11—Global service counter ID / counter name 12—Subscriber service counter ID / counter name 13—Package counter ID / counter name 15—UDP port number / port name 1002—VoIP signature protocol ID / protocol name 2001—P2P subscriber service counter ID / counter 2002—VoIP subscriber service counter ID / counter 3001—P2P global service counter ID / counter 3002—VoIP global service counter ID / counter
VALUE_KEY	String	Key name. For example: Gold, Silver, or Adult Browsing.
VALUE	Number	Numeric reference.

Table CONF_SE_TZ_OFFSET

Database table CONF_SE_TZ_OFFSET contains the time-zone offset in minutes for each SCE platform's clock as configured by the *select-sce-tz.sh* script.

Table 3-13 Columns for Table CONF_SE_TZ_OFFSET

Field Name	Type
TIME_STAMP	DateTime
OFFSET_MIN	Number

CSV File Formats

The *Service Control Application for Broadband (SCA BB)* provides several types of Comma-Separated Value (CSV) flat files that you can review and configure using third-party applications such as Excel.

This chapter contains the following sections:

- [Service Configuration Entities CSV File Formats 4-1](#)
- [Subscriber CSV File Formats 4-4](#)
- [Collection Manager CSV File Formats 4-6](#)

Service Configuration Entities CSV File Formats

This section describes the file formats of the CSV files created when exporting service configuration entities into CSV files. The same format must be used for importing such entities into service configurations.

For more information about exporting and importing service configuration entities, see “Managing Service Configurations” in the “Using the Service Configuration Editor” chapter of the *Cisco Service Control Application for Broadband User Guide*.

Note

There is no need to repeat the same values in subsequent rows of the CSV file. If a field is left empty in a row, the value of that field from the previous row is used.

Service CSV Files

Lines in Service CSV files have the following fixed format:

```
service name, service numeric ID, [description], sample rate, parent name,  
global counter index, subscriber counter index, [flavor], initiating side,  
protocol, [zone]
```

- The only service that does not have a parent service is the default service.
- The default service is the parent of all other services.
- If the service will be counted with its parent, it must have a counter index of -1.

- One service can have multiple entries in the file (see the following example). There is no need to state the service properties for each of its items.
- Some fields can take a null value (see the last line of the following example).

EXAMPLE

The following is an example of a service CSV file:

```
P2P,9,,10,Default Service,9,9,,EitherSide,DirectConnect,zone1
P2P,9,,10,Default Service,9,9,flavor1,EitherSide,Manolito, zone1
,,,,,,EitherSide,Hotline, zone1
,,,,,, flavor2,EitherSide,Share, zone1
Generic,1,,10,Default Service,-1,-1,No items,null,null,null
```

Protocol CSV Files

Lines in Protocol CSV files have the following fixed format:

```
protocol name, protocol index, [IP protocol], [port range], signature
```

One protocol can have multiple entries in the file (see the following example).

Port range has the format: MinPort-MaxPort. For example, 1024-5000 means port 1024 to port 5000.

EXAMPLE

The following is an example of a protocol CSV file:

```
HTTP Browsing,2,TCP,80-80,Generic
HTTP Browsing,2,TCP,8080-8080,Generic
HTTP Browsing,2,,HTTP
```

Zone CSV Files

Lines in Zone CSV files have the following fixed format:

```
zone name, zone index, IP range
```

where IP range is an IP address in dotted notation, followed by a mask.

EXAMPLE

The following is an example of a zone CSV file:

```
zone1,1,10.1.1.0/24
,,10.1.2.0/24
```

Flavor CSV Files

The format of flavor CSV files depends on the flavor type.

Each line of every flavor CSV files begins with the same three fields:

```
flavor name, flavor index, flavor type[, flavor specific field[s]]
```

The formats of the CSV files of different flavors are described in the following sections.

EXAMPLE

The following is an example of a line from a flavor CSV file:

```
HttpUrlFlavor,1,HTTP_URL
```

HTTP URL

Lines in HTTP URL CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, host suffix, params prefix,  
URI suffix, URI prefix
```

EXAMPLE

The following is an example of an HTTP URL CSV file:

```
NEWS,0,HTTP_URL,*.reuters.com,,,/news/*  
,,,*.msnbc.msn.com,,,  
,,,*.wired.com,,,/news/technology/*  
,,,*.cbsnews.com,,,/sections/world/*  
,,,*.cnn.com,,,/WORLD/*
```

HTTP User Agent

Lines in HTTP User Agent CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, user agent
```

HTTP Composite

Lines in HTTP Composite CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, HTTP_URL_name, HTTP_User_Agent_name
```

where `HTTP_URL_name` and `HTTP_User_Agent_name` are the names of existing flavors of types HTTP URL and HTTP User Agent respectively

RTSP User Agent

Lines in RTSP User Agent CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, user agent
```

RTSP Host Name

Lines in RTSP Host Name CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, host suffix
```

RTSP Composite

Lines in HTTP Composite CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, RTSP_Host_Name, RTSP_User_Agent_name
```

where `RTSP_Host_Name` and `RTSP_User_Agent_name` are the names of existing flavors of types RTSP Host Name and RTSP User Agent respectively

SIP Destination Domain

Lines in SIP Destination Domain CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, host suffix
```

SIP Source Domain

Lines in SIP Source Domain CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, host suffix
```

SIP Composite

Lines in HTTP Composite CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, SIP_Destination_Domain_name,
SIP_Source_Domain_name
```

where `SIP_Destination_Domain_name` and `SIP_Source_Domain_name` are the names of existing flavors of types SIP Destination Domain and SIP Source Domain respectively

SMTP Host Name

Lines in SMTP Host Name CSV files have the following fixed format:

```
flavor name, flavor index, flavor type, host suffix
```

Subscriber CSV File Formats

This section describes the file formats of various subscriber CSV files used by the Cisco Service Control Management Suite (SCMS) Subscriber Manager (SM). For more information regarding these CSV file formats, see “Subscriber Files” in the “Managing Subscribers” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide* and see the *Cisco Service Control Management Suite Subscriber Manager User Guide*.

Import/Export File: Format of the mappings Field

Some of the CSV files include a *mappings* field. This field can include one or more of the following values delimited by colons (“:”) or semicolons (“;”):

- A single IP address in dotted notation (xx.xx.xx.xx).
- An IP address range in dotted notation (xx.xx.xx.xx/mask).
- A single VLAN (xx) as an integer in decimal notation in the range of 0 to 2044.
- A VLAN range (xx-yy) where both values are integers in decimal notation in the range of 0 to 2044.

Note

Specifying VLAN and IP Mappings together in the same line is not allowed.

EXAMPLES

- Multiple IP mappings—10.1.1.0/24;10.1.2.238
- Multiple VLAN mappings—450:896-907

SCE Subscriber CSV Files

Lines in SCE Subscriber CSV files have the following fixed format:

```
subscriber-id, mappings, package-id
```

EXAMPLE

The following is a sample CSV file for use with the SCE CLI:

```
JerryS,80.179.152.159;80.179.152.179,0  
ElainB,194.90.12.2,3
```

SCMS SM Subscriber CSV Files

Lines in SCMS SM Subscriber CSV files have the following fixed format:

```
subscriber-id, domain, mappings, package-id
```

If no domain is specified, the default domain (subscribers) is assigned.

EXAMPLE

The following is a sample CSV file for use with the SM CLI:

```
JerryS,subscribers,80.179.152.159,0  
ElainB,,194.90.12.2,3
```

SCE Anonymous Group CSV Files

Lines in SCE Anonymous Group CSV files have the following fixed format:

```
anonymous-group-name, IP-range[, subscriber-template-number]
```

If no subscriber-template-number is specified, then the anonymous subscribers of that group will use the default template (equivalent to using a subscriber-template-number value of zero).

The mapping between subscriber-template-number and package-id is defined in the SCE Subscriber Template CSV file, which is described in the following section.

SCE Subscriber Template CSV File

Lines in Subscriber Template CSV files have the following fixed format, as described below:

```
subscriber-template-number, package-id
```

SCA BB includes a default one-to-one mapping between package-id and subscriber-template-number for values from 0 to 63.

Subscriber-template-numbers can take values between 0 and 199. You can map more than one subscriber-template-number to the same package-id.

For complete information about this file, see the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

Collection Manager CSV File Formats

This section describes the file formats of the CSV files created by adapters of the Cisco Service Control Management Suite (SCMS) Collection Manager (CM). For more information about the CM and its adapters, see the *Cisco Service Control Management Suite Collection Manager User Guide*.

Each RDR is routed to the appropriate adapter—the Comma-Separated Value (CSV) Adapter, the Topper/Aggregator (TA Adapter), or the Real-Time Aggregating (RAG) Adapter—converted, and written to a CSV file.

CSV Adapter CSV Files

By default, the CSV Adapter writes files to subdirectories of `~/cm/adapters/CSVAdapter/csvfiles`, where each subdirectory name is the RDR tag of the RDR that generated the CSV file.

Each CSV file created by the CSV Adapter has a structure matching the RDR that is represented in the file. (See *Raw Data Records: Formats and Field Contents* (on page 2-1).)

TA Adapter CSV Files

The TA Adapter receives Subscriber Usage RDRs, aggregates the data they contain, and outputs statistics to CSV files. By default, these files are created once every 24 hours, at midnight.

The name of the CSV file is the date and time of its creation. The default format of the file name is `yyyy-MM-dd_HH-mm-ss.csv` (for example, `2005-09-27_18-30-01.csv`). By default, the location of the CSV files is `~/cm/adapters/TAAdapter/csvfiles`.

By default, the fields in each row of the CSV file are as follows:

```
TIMESTAMP, TAG, subsID, svcALLup, svcALLdown, svcALLsessions, svcALLseconds,
svc0up, svc0down, svc0sessions, svc0seconds, svc1up, svc1down, svc1sessions,
svc1seconds, ..., svcNup, svcNdown, svcNsessions, svcNseconds
```

where `subsID` is the Subscriber ID and `svcXY` is the aggregated volume of metric `Y` for service `X`. (The `N` in `svcN` is the highest service number, which is the configured number of services minus 1.)

The combined volume is not stored in the CSV file, since it is easily obtained by adding the upstream and downstream volumes.

You can configure the adapter to insert a comment at the beginning of every CSV file. This comment contains a time stamp showing when the file was created, and an explanation of its format. By default, this feature is disabled. To turn this option on, edit the file `csvadapter.conf` and change the value of `includeRecordSource`.

RAG Adapter CSV Files

The RAG Adapter processes RDRs of one or more types and aggregates the data from predesignated field positions into *buckets*. When a RAG Adapter bucket is flushed, its content is written as a single line into a CSV file, one file per RDR, in the adapters' CSV repository.

The name of the CSV file is the date and time of its creation. The default format of the file name is `yyyy-MM-dd_HH-mm-ss.csv` (for example, `2005-09-27_18-30-01.csv`). By default, the CSV repository is flat (all CSV files in one directory), and located at `~/cm/adapters/RAGAdapter/csvfiles`. Alternatively, you can configure the adapter to use a subdirectory structure; the CSV files are written to subdirectories of `~/cm/adapters/RAGAdapter/csvfiles`, where each subdirectory name is the RDR tag of the RDR type that was written to this CSV file.

Each line written to the CSV file may have some synthesized fields added to it, such as time stamps of the first and last RDRs that contributed to this bucket and the total number of RDRs in this bucket. Other fields may be removed altogether. Fields in the output line that are not used for aggregation will have values corresponding to the values in the first RDR that contributed to the bucket. However, the time stamp field that is prepended to the line in the CSV file will have a value corresponding to the time stamp of the last RDR in the bucket.

SCA BB Proprietary MIB Reference

This chapter describes the proprietary CISCO-SCAS-BB Management Information Base (MIB) supported by the Service Control Engine (SCE) platform.

A *MIB* is a database of objects that can be monitored by a network management system (NMS). The SCE platform supports both the standard MIB-II and the proprietary Cisco Service Control Enterprise MIB. The CISCO-SCAS-BB MIB is the part of the Service Control Enterprise MIB that enables the external management system to monitor counters and metrics specific to the *Service Control Application for Broadband (SCA BB)*.

This chapter contains the following sections:

- [SNMP Configuration and Management](#) 5-1
- [Service Control Enterprise MIB](#) 5-3
- [The CISCO-SCAS-BB MIB](#) 5-4
- [pcubeEngageObjs \(pcubeWorkgroup 2\)](#) 5-4
- [Service Group: serviceGrp \(pcubeEngageObjs 1\)](#) 5-6
- [Link Group: linkGrp \(pcubeEngageObjs 2\)](#) 5-7
- [Package Group: packageGrp \(pcubeEngageObjs 3\)](#) 5-11
- [Subscriber Group: subscriberGrp \(pcubeEngageObjs 4\)](#) 5-17
- [Service Counter Group: serviceCounterGrp \(pcubeEngageObjs 5\)](#)
- [Guidelines for Using the CISCO-SCAS-BB MIB](#) 5-23

SNMP Configuration and Management

This section explains how to configure the SNMP interface, and how to load the MIB files.

Configuring the SNMP Interface on the SCE platform

Before using the SNMP interface:

- Enable SNMP access on the SCE platform (by default, SNMP access is disabled).
- Set the values of SNMP parameters:

- The community string to be used for client authentication.
- (Optional, recommended as a security measure) An access-list (ACL) of IP addresses. This limits access to SNMP information to a set of known locations. You can define a different community string for each ACL.
- The destination IP address to which the SCE platform will send SNMP traps.

You can enable or disable specific traps.

For complete documentation of SNMP configuration, see “SNMP Configuration and Management” in the “Configuring the Management Interface and Security” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

Required MIB Files

To access the SNMP variables on the SCE platform, you must load the SNMP browser with a standard MIB file (*SNMPv2.mib*) and proprietary Cisco MIB files (*pcube.mib*, *pcubeSEMib.mib*, and *PCubeEngageMib.mib*).

Loading the MIB Files

The *SCA BB* proprietary MIB uses definitions that are defined in other MIBs, such as *SNMPv2.mib* and *pcube.mib*.

This means that the order in which the MIBs are loaded is important; to avoid errors, the MIBs must be loaded in the correct order.

Note You can download the CISCO-SCAS-BB MIB file (*PCubeEngageMib.mib*) and other MIB files (*pcube.mib* and *pcubeSEMib.mib*) from <ftp://ftp.cisco.com/pub/mibs/>.

To load the MIBs:

-
- Step 1** Load *SNMPv2.mib*.
 - Step 2** Load *pcube.mib*.
 - Step 3** Load *pcubeSEMib.mib*.
 - Step 4** Load *PCubeEngageMib.mib*.
-

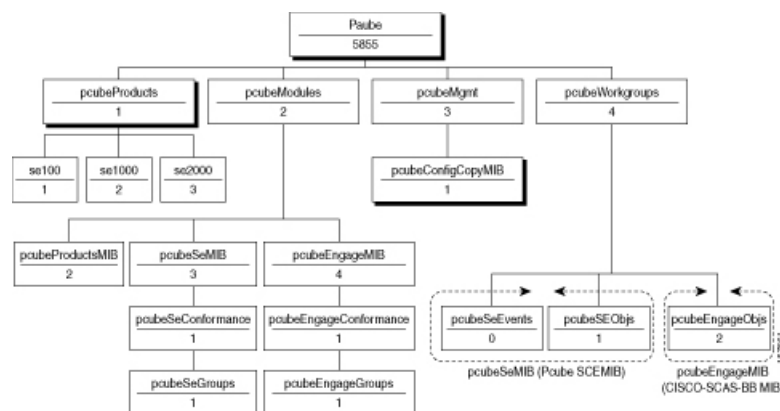

Service Control Enterprise MIB

The Service Control Enterprise MIB splits into four main groups: Products, Modules, Management, and Workgroup. The Service Control enterprise tree structure is defined in a MIB file named *pcube.mib*.

- The *pcubeProducts* subtree contains the *sysObjectIDs* of the Service Control products. Service Control product *sysObjectIDs* are defined in a MIB file named *Pcube-Products-MIB*.
- The *pcubeModules* subtree provides a root object identifier from which MIB modules are defined.
- The *pcubeMgmt* subtree contains the configuration copy MIB:
 - *pcubeConfigCopyMib* enables saving the running configuration of Cisco products. This MIB is documented in the “Proprietary MIB Reference” appendix of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.
- The *pcubeWorkgroup* subtree contains:
 - *pcubeSeEvents* and *pcubeSEObjs*—*pcubeSeMib*, the SCE MIB, is the main MIB for the Service Control products and provides a wide variety of configuration and runtime statistics. This MIB is also documented in the “Proprietary MIB Reference” appendix of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.
 - *pcubeEngageObjs*—The CISCO-SCAS-BB MIB provides configuration and runtime status for **SCA BB**, and is described in the following section.

The following figure illustrates the Service Control Enterprise MIB structure.

Figure 5-1: Cisco Service Control MIB Structure

Note

The following object identifier represents the Service Control Enterprise MIB:
1.3.6.1.4.1.5655 or *iso.org.dod.internet.private.enterprise.pcube*.

The CISCO-SCAS-BB MIB

The CISCO-SCAS-BB MIB provides access to service counters through the SNMP interface. Using this MIB, a network administrator can collect usage information per service at link, package, or subscriber granularity.

The CISCO-SCAS-BB MIB is defined in the file *PCubeEngageMib.mib*.

The MIB is documented in the remainder of this chapter.

Using this Reference

This reference is divided into sections according to the MIB object groups. For each object, information is presented in the following format:

<Description of the object>

Access access control associated with the object

Units unit of measurement used for the object

INDEX

{Indexes used by the table}

SYNTAX

OBJECT DATA TYPE {

The general format of the object

}

pcubeEngageObjs (pcubeWorkgroup 2)

The pcubeEngageObjs objects provide current information about packages, service, and subscribers.

pcubeEngageObjs Objects

This is a list of the pcubeEngageObjs objects. Each object consists of a number of subordinate object types, as summarized in the following section.

<i>serviceGrp</i>	<i>{pcubeEngageObjs 1}</i>
<i>linkGrp</i>	<i>{pcubeEngageObjs 2}</i>
<i>packageGrp</i>	<i>{pcubeEngageObjs 3}</i>
<i>subscriberGrp</i>	<i>{pcubeEngageObjs 4}</i>
<i>serviceCounterGrp</i>	<i>{pcubeEngageObjs 5}</i>

pcubeEngageObjs Structure

This is a summary of the structure of pcubeEngageObjs. Note the table structure for objects that may have multiple entries.

serviceGrp

serviceTable—deprecated

linkGrp

linkServiceUsageTable

linkServiceUsageEntry

linkServiceUsageUpVolume

linkServiceUsageDownVolume

linkServiceUsageNumSessions

linkServiceUsageDuration

linkServiceUsageConcurrentSessions

linkServiceUsageActiveSubscribers

linkServiceUpDroppedPackets

Service Group: serviceGrp (pcubeEngageObjs 1)

The Service Group is deprecated. Use the Service Counter Group.

serviceTable (serviceGrp 1)

Deprecated—Use the tables in the service counter group.

Access not-accessible

SYNTAX

Counter32

Link Group: linkGrp (pcubeEngageObjs 2)

The Link Service group provides usage information per link for each global-scope service counter (for example, traffic statistics of a service for all subscribers using a particular link).

linkServiceUsageTable (linkGrp 1)

The Link Service Usage table provides usage information per link for each global-scope service counter.

Access not-accessible

SYNTAX

SEQUENCE OF linkServiceUsageEntry

linkServiceUsageEntry (linkServiceUsageTable 1)

A Link Service Usage table entry containing parameters defining resource usage of one link for services included in one global-scope service counter.

Access not-accessible

INDEX

{linkModuleIndex, linkIndex, globalScopeServiceCounterIndex}

SYNTAX

SEQUENCE {

linkServiceUsageUpVolume

linkServiceUsageDownVolume

linkServiceUsageNumSessions

linkServiceUsageDuration

linkServiceUsageConcurrentSessions

linkServiceUsageActiveSubscribers

linkServiceUpDroppedPackets

linkServiceDownDroppedPackets

linkServiceUpDroppedBytes

linkServiceDownDroppedBytes

}

Link Group: linkGrp (pcubeEngageObjs 2)

linkServiceUsageUpVolume (linkServiceUsageEntry 1)

The upstream volume of services in this service counter carried over the link.

Access read-only

Units kilobytes

SYNTAX

Counter32

**Note**

Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

linkServiceUsageDownVolume (linkServiceUsageEntry 2)

The downstream volume of services in this service counter carried over the link.

Access read-only

Units kilobytes

SYNTAX

Counter32

linkServiceUsageNumSessions (linkServiceUsageEntry 3)

The number of sessions of services in this service counter carried over the link.

Access read-only

Units sessions

SYNTAX

Counter32

linkServiceUsageDuration (linkServiceUsageEntry 4)

The aggregated session duration of services in this service counter carried over the link.

Access read-only

Units seconds

SYNTAX

Counter32

linkServiceUsageConcurrentSessions (linkServiceUsageEntry 5)

The number of concurrent sessions of services in this service counter carried over the link.

Access read-only

Units sessions

SYNTAX

Counter32

linkServiceUsageActiveSubscribers (linkServiceUsageEntry 6)

The number of active subscribers of services in this service counter carried over the link.

Access read-only

Unit subscribers

SYNTAX

Counter32

linkServiceUpDroppedPackets (linkServiceUsageEntry 7)

The number of dropped upstream packets of services in this service counter carried over the link.

Access read-only

Units packets

SYNTAX

Counter32

Note

To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value `0xFFFFFFFF`. For more information about the `accelerate-packet-drops` feature, see “Counting Dropped Packets” in the “Configuring the Line Interface” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

Link Group: linkGrp (pcubeEngageObjs 2)

linkServiceDownDroppedPackets (linkServiceUsageEntry 8)

The number of dropped downstream packets of services in this service counter carried over the link.

Access read-only

Units packets

SYNTAX

Counter32

Note

To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more information about the `accelerate-packet-drops` feature, see “Counting Dropped Packets” in the “Configuring the Line Interface” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

linkServiceUpDroppedBytes (linkServiceUsageEntry 9)

The number of dropped upstream bytes of services in this service counter carried over the link.

Access read-only

Units bytes

SYNTAX

Counter32

Note

To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more information about the `accelerate-packet-drops` feature, see “Counting Dropped Packets” in the “Configuring the Line Interface” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

linkServiceDownDroppedBytes (linkServiceUsageEntry 10)

The link service-counter number of dropped downstream bytes of services in this service counter carried over the link.

Access read-only

Units bytes

SYNTAX

Counter32

Note

To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value `0xFFFFFFFF`. For more information about the `accelerate-packet-drops` feature, see “Counting Dropped Packets” in the “Configuring the Line Interface” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

Package Group: packageGrp (pcubeEngageObjs 3)

The Package group provides general and usage information for each global-scope package counter (for example, traffic statistics of a service for all subscribers assigned to a particular package or group of packages).

packageCounterTable (packageGrp 1)

The Package Counter table provides information for each package counter.

Access not-accessible

SYNTAX

SEQUENCE OF packageCounterEntry

Package Group: packageGrp (pcubeEngageObjs 3)

packageCounterEntry (packageCounterTable 1)

A Package Counter table entry containing parameters defining one package counter.

Access not-accessible

INDEX

{pmoduleIndex, packageCounterIndex}

SYNTAX

```
SEQUENCE {
    packageCounterIndex
    packageCounterStatus
    packageCounterName
    packageCounterActiveSubscribers
}

Counter32

Note

To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value `0xFFFFFFFF`. For more information about the `accelerate-packet-drops` feature, see “Counting Dropped Packets” in the “Configuring the Line Interface” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

packageServiceUpDroppedBytes (packageServiceUsageEntry 9)

The number of dropped upstream bytes of packages in this package counter.

Access read-only

Units bytes

SYNTAX

Counter32

Note

To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value `0xFFFFFFFF`. For more information about the `accelerate-packet-drops` feature, see “Counting Dropped Packets” in the “Configuring the Line Interface” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

packageServiceDownDroppedBytes (packageServiceUsageEntry 10)

The number of dropped downstream bytes of packages in this package counter.

Access read-only

Units bytes

SYNTAX

Counter32

Note

To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value `0xFFFFFFFF`. For more information about the `accelerate-packet-drops` feature, see “Counting Dropped Packets” in the “Configuring the Line Interface” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

Subscriber Group: subscriberGrp (pcubeEngageObjs 4)

The Subscriber group provides general information for each subscriber and usage information per service counter for each subscriber (for example, traffic statistics of a service for a particular subscriber that is defined in the system).

Note

To use the tables in this group, first create an entry to reference a particular subscriber in the `subscribersPropertiesValueTable` object of the `subscriberGrp` in the SCE MIB (not the CISCO-SCAS-BB MIB). Using the index of this table (`spvIndex`), information about the subscriber can be collected. See *Accessing Subscriber Information (the spvIndex)* (on page 5-24) for more information on how to access subscriber-level information using the SNMP interface.

subscribersTable (subscriberGrp 1)

The Subscribers Table provides information for each subscriber.

Access not-accessible

SYNTAX

SEQUENCE OF subscribersEntry

Subscriber Group: subscriberGrp (pcubeEngageObjs 4)

subscribersEntry (subscribersTable 1)

A Subscribers Table entry containing the package index of each subscriber.

Access not-accessible

INDEX

{*pmoduleIndex*, *spvIndex*}

SYNTAX

```
SEQUENCE {
  subscriberPackageIndex
}
```

subscriberPackageIndex (subscribersEntry 1)

The package index of the subscriber's package.

Access read-only

SYNTAX

Integer32 (1...255)

subscriberServiceUsageTable (subscriberGrp 2)

The Subscriber Service Usage table provides usage information per service counter for each subscriber.

Access not-accessible

SYNTAX

Sequence of subscriberServiceUsageEntry

subscriberServiceUsageEntry (subscriberServiceUsageTable 1)

A Subscriber Service Usage table entry containing parameters defining resource usage by one subscriber of services included in one service counter.

Access not-accessible

INDEX

{*pmoduleIndex*, *spvIndex*, *subscriberScopeServiceCounterIndex*}

SYNTAX

```
SEQUENCE {
  subscriberServiceUsageUpVolume
  subscriberServiceUsageDownVolume
  subscriberServiceUsageNumSessions
  subscriberServiceUsageDuration
}
```

subscriberServiceUsageUpVolume (subscriberServiceUsageEntry 1)

The upstream volume of services in this service counter used by this subscriber.

Access read-only

Unit kilobytes

SYNTAX

Counter32

Note

Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

subscriberServiceUsageDownVolume (subscriberServiceUsageEntry 2)

The downstream volume of services in this service counter used by this subscriber.

Access read-only

Unit kilobytes

SYNTAX

Counter32

Note

Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

subscriberServiceUsageNumSessions (subscriberServiceUsageEntry 3)

The number of sessions of services in this service counter used by this subscriber.

Access read-only

Unit sessions

SYNTAX

Integer32 (1 . . . 65535)

Service Counter Group: serviceCounterGrp (pcubeEngageObjs 5)

subscriberServiceUsageDuration (subscriberServiceUsageEntry 4)

Aggregated session duration of services in this service counter used by this subscriber.

Access read-only

Units seconds

SYNTAX

Integer32 (1 . . . 65535)

Service Counter Group: serviceCounterGrp (pcubeEngageObjs 5)

The Service Counter group provides general information for each global-scope and subscriber-scope service counter. You can use it, for example, to read the names of the services as defined in a *SCA BB* service configuration.

globalScopeServiceCounterTable (serviceCounterGrp 1)

The Global-Scope Service Counter table consists of data regarding each service counter used by the link and by packages.

Access not-accessible

SYNTAX

SEQUENCE OF globalScopeServiceCounterEntry

globalScopeServiceCounterEntry (globalScopeServiceCounterTable 1)

A Global-Scope Service Counter table entry containing parameters defining one global-scope service counter.

Access not-accessible

INDEX

{ *pmoduleIndex*, *globalScopeServiceCounterIndex* }

SYNTAX

```
SEQUENCE {
  globalScopeServiceCounterIndex
  globalScopeServiceCounterStatus
  globalScopeServiceCounterName
}
```

globalScopeServiceCounterIndex (globalScopeServiceCounterEntry 1)

The global-scope service counter index.

Access not-accessible

SYNTAX

Integer32 (1...255)

globalScopeServiceCounterStatus (globalScopeServiceCounterEntry 2)

The global-scope service counter status.

Access read-only

SYNTAX

```
INTEGER {  
  0 (disabled)  
  1 (enabled)  
}
```

globalScopeServiceCounterName (globalScopeServiceCounterEntry 3)

The name of the global-scope service counter.

Access read-only

SYNTAX

SnmpAdminString

subscriberScopeServiceCounterTable (serviceCounterGrp 2)

The Subscriber-Scope Service Counter table consists of data regarding each service counter used by subscribers.

Access not-accessible

SYNTAX

SEQUENCE OF subscriberScopeServiceCounterEntry

subscriberScopeServiceCounterEntry (subscriberScopeServiceCounterTable 1)

A Subscriber-Scope Service Counter table entry containing parameters defining one subscriber-scope service counter.

Access not-accessible

INDEX

{pmoduleIndex, subscriberScopeServiceCounterIndex}

SYNTAX

```
SEQUENCE {
  subscriberScopeServiceCounterIndex
  subscriberScopeServiceCounterStatus
  subscriberScopeServiceCounterName
}
```

subscriberScopeServiceCounterIndex (subscriberScopeServiceCounterEntry 1)

The subscriber-scope service counter index.

Access not-accessible

SYNTAX

Integer32 (1...255)

subscriberScopeServiceCounterStatus (subscriberScopeServiceCounterEntry 2)

The subscriber-scope service counter status.

Access read-only

SYNTAX

```
INTEGER {
  0 (disabled)
  1 (enabled)
}
```

subscriberScopeServiceCounterName (subscriberScopeServiceCounterEntry 3)

The name of the subscriber-scope service counter.

Access read-only

SYNTAX

SnmpAdminString

Guidelines for Using the CISCO-SCAS-BB MIB

This section provides guidelines to help access SNMP information on the SCE platform using the CISCO-SCAS-BB MIB.

Important Note

Indices in SNMP start from 1; *SCA BB* indices start from 0. When accessing a counter in the *SCA BB* SNMP MIB by its index, add 1 to the index of the entity. For example, the Global Counter with index 0 will be located at `globalScopeServiceCounter` index 1.

Note

Although volume counters on the SCE platform hold 32-bit integers, CISCO-SCAS-BB MIB volume counters wraparound (turn back to zero) when the maximum 29-bit integer value (0x1FFFFFFF) is reached.

Note

To enable the SCE application to count dropped packets and dropped bytes, disable the `accelerate-packet-drops` feature on the SCE platform; if `accelerate-packet-drops` is enabled, the MIB dropped packets and dropped bytes counters constantly show the value 0xFFFFFFFF. For more information about the `accelerate-packet-drops` feature, see “Counting Dropped Packets” in the “Configuring the Line Interface” chapter of the *Cisco Service Control Engine (SCE) Software Configuration Guide*.

globalScopeServiceCounterTable and subscriberScopeServiceCounterTable

The index of a service counter as defined in a *SCA BB* service configuration is used to reference services in the CISCO-SCAS-BB MIB. Since MIB index values count from 1, but *SCA BB* indices count from 0, the index used in the MIB must always be one greater than the index of the service it is referencing.

For example, to get the number of upstream bytes used by a service on a link, use `LinkServiceTable.lnkServiceUpVolume` (part of the `linkGrp`). The value assigned to `serviceIndex` for this table must be one greater than service index defined for this service in the service configuration.

To identify or change the index of a service, go to the Advanced tab of the Service Settings dialog box in the Console (see the “Using the Service Configuration Editor: Traffic Classification” chapter of the *Cisco Service Control Application for Broadband User Guide*). For example, to reference the P2P service (which has a (default) service index of 9) in the MIB, a `serviceIndex` of 10 (= 9 + 1) must be used.

packageCounterTable

The package index, defined in a *SCA BB* service configuration, is used to reference entries in `packageTable` and `packageServiceTable` (part of the `packageGrp`). As with `serviceIndex` the value assigned to `packageIndex` must be one greater than the package index in the service configuration.

To identify or change the index of a package, go to the Advanced tab of the Package Settings dialog box in the Console (see the “Using the Service Configuration Editor: Traffic Control” chapter of the *Cisco Service Control Application for Broadband User Guide*). For example, to reference the default package (which has a package index of 0) in the MIB, a `packageIndex` of 1 (= 0 + 1) must be used.

Accessing Subscriber Information (the `spvIndex`)

In order to collect subscriber-level information using the SNMP interface, you must first create an entry in the `subscriberPropertiesValuesTable` part of the `subscriberGrp` in `pcubeSEMib` (not `PCubeEngageMib`). After an entry in this table is created and associated with a subscriber name, its index (`spvIndex`) can be referred to in `PCubeEngageMib` to collect usage statistics for this subscriber.

An entry is created in the `subscriberPropertiesValuesTable` table by setting the entry `spvRowStatus` object with `CreateAndGo(4)` then setting the name of the subscriber in the `spvSubName` property and the `spvIndex` variable to be used as an index to the subscriber.

For example, to poll the downstream volume of subscriber “sub123” for the P2P service using `PCubeEngageMib`, perform the following steps.

-
- Step 1** Obtain the index of the P2P service from the Console. (This is a one-time operation that should be performed only if services are changed in the policy.) [In this example, assume that the P2P service index has its default value of 9.]
 - Step 2** Create an entry in `SEMib:subscriberGrp:subscriberPropertiesValuesTable`.
 - Step 3** Set the object indices:
 - For `pmoduleIndex` use 1.
 - Set `spvIndex` to the desired value. [In this example we will use 1.]
 - Step 4** Set `spvRowStatus` to 4 (using `CreateAndGo`).
 - Step 5** Set `spvSubName` to “sub123”.
 - Step 6** Read the `subscriberServiceDownVolume` property out of `EngageMib:subscriberGrp:subscriberServiceTable` where `spvIndex` is set to 1 and `serviceIndex` is set to 10.
-

Glossary of Terms

A

Active subscriber

An online subscriber that is actually generating IP traffic.

Anonymous subscriber mode

A mode in which entities defined as IP addresses or VLANs are treated as subscribers. The correlation to actual subscriber IDs is not performed by the system, but is performed externally by the collection system. Anonymous subscriber mode does not require an SCMS-SM.

C

CLI

One of the management interfaces to the SCE platform. The CLI is accessed through a Telnet session or directly via the console port on the front panel of the SCE platform.

CM

A software application running on a Solaris or Linux platform that is responsible for receiving RDRs from the SCE platform and processing them.

Command-Line Interface

See CLI.

D

Domains

A group of SCE platforms that share a group of subscribers. The subscriber traffic can pass through any SCE platform in the domain.

A subscriber and an SCE can belong to only one domain.

Downstream traffic

Traffic entering the SCE platform from the network side (that is, flowing toward the subscribers).

E

External Quota Management

Provisioning of per-service quotas for individual subscribers by an external system, such as a prepaid server or a policy controller.

In external quota provisioning, usage counters are not automatically reset at the end of an aggregation period, nor is a specific quota limit provided uniformly to all subscribers as part of the package parameters. Instead, the quotas are provisioned individually via the external quota management system.

F

Flow

All packets traveling in both directions on a single application-layer connection (such as a TCP or UDP connection). A flow is identified by the tuple information: <Source IP, Destination IP, Source Port, Destination Port, IP Protocol>. (Note that if the IP protocol is neither TCP nor UDP, the port number is defined as 0.)

In this guide, the term “flow” represents bidirectional flows (packets from both the client and server of each connection). A unidirectional flow is always mentioned explicitly.

Flow bundle

A group of one or more flows comprising the set of application-layer connections (such as a TCP or UDP connection) used in a single, logical application session. The semantics of flow bundles are application dependent and relate to the way each application spawns and negotiates additional flows as part of a single session. A few common examples are:

- An SIP (VoIP) flow bundle comprises the signaling flow and all the RTP/UDP flows containing the actual media data (voice)
- An RTSP (Streaming) flow bundle comprises the signaling flow and the RTP/UDP flows containing the audio and video transmissions
- AN FTP (file transfer) flow bundle comprises the control flow (used to log in to an FTP server) and the actual file-transfer flows

In each of these examples, the SCE platform tracks the application communication to identify new connections created and bundle them into a single context. This is important for classification and accounting, otherwise these spawned flows would be misclassified.

O**Online subscriber**

A subscriber that is currently online. At any particular time, a number of online subscribers will be idle.

P**Package**

A collection of business policy rules, defining access levels to various services, charging parameters, and traffic control actions to be taken upon predefined events. Subscribers are assigned packages (plans) that determine how their network transactions are controlled and charged.

Q**Quota**

A (subscriber's) limit for a specific metric, such as bandwidth or volume.

Quota buckets

When the external quota management mode is selected, subscriber usage of a service is consumed from a predefined subscriber quota bucket. Each subscriber has four subscriber quota buckets. When a quota bucket is depleted, services that try to consume from that bucket are *breached*.

A quota manager that is external to the Service Control system replenishes quota buckets.

R**Raw Data Record**

See RDR.

RDR

A data record produced by the SCE platform that reports events in the traffic. RDRs produced by the SCE platform are sent to the Cisco Service Control Management Suite Collection Manager and then stored in the Collection Manager database or forwarded to third-party systems. The RDR typically contains a quota (*see* Quota) request or reports service usage.

RDR Formatter

An internal component of the SCE platform that gathers the Raw Data Records (RDRs), formats them, and sends them to an external Cisco Service Control Management Suite Collection Manager.

Real-time subscriber usage monitoring

Subscribers are monitored in detail. Usage information is reported frequently by the SCE platform to facilitate detailed reports.

S**SCA BB Console[bb]**

The user interface used for controlling the Cisco Service Control Application for Broadband. You use the Console to create, modify, and apply service configurations.

SCE platform

The SCE platform is a purpose-built service component and active enforcing system designed for enhancing service providers and backbone carrier networks. By identifying, classifying, and manipulating complex traffic flows at wire speed, the SCE platform transforms simple transport networks into differentiated service delivery infrastructures for a wide variety of value-added IP applications, such as video streaming, VoIP, tiered services, and bilateral application-level SLAs.

The SCE platform seamlessly interfaces with existing network elements—including routers, switches, aggregators, subscriber management devices, and operational support systems—using industry-standard interfaces and communications protocols.

The need to guarantee that packets passing through the network are processed at the rate at which they arrive makes it necessary to provide a custom-made hardware solution.

The SCE platform comes in three models—SCE 1000, SCE 2000 4xGBE, and SCE 2000 4/8xFE. There may be one or more SCE platforms in the provider network. In the SCE platform, network transactions are analyzed and mapped to services that enforce the provider's policies.

The SCE platform also implements the business logic of the system solution and performs transaction analysis in real-time. When so instructed, the SCE platform creates a Raw Data Record (RDR) that is sent for storage to the system's data repository, the Cisco Service Control Management Suite Collection Manager, or carries out other operations such as bandwidth or volume control.

Service

A value-added offering given by the service provider to its subscribers on top of its access network.

For each such commercial service the providers offer to their subscribers, a corresponding service is defined in the Cisco Service Control solution for classifying and identifying network transaction associated with the service, reporting on its usage, and controlling its traffic according to the business policy.

Service Configuration

The definition of services in the Cisco Service Control solution, the mapping of network transactions to their corresponding services, and the behavior of the SCE platform on them. A service configuration includes the definition of services, packages, bandwidth controllers, filter rules, and so on.

Service Control

The basic Cisco concept for enabling service providers to differentiate subscribers, detect real-time events, create premium services, actively control applications, and leverage their existing infrastructure.

Service Control Engine platform

See SCE platform.

Service Control Management Suite Collection Manager

See CM.

Service Control Management Suite Subscriber Manager

See SM.

Service rule

A service is assigned to a package by defining a service rule for the package.

Session (also called Transaction)

An instance of communication between network hosts. A precise definition of a session is application-protocol (Layer 7) dependent.

Signature

A set of parameters that uniquely identify a protocol.

SM

A middleware software component used where dynamic binding of subscriber information and service configurations is required. The SM manages subscriber information and provisions it in real time to multiple SCE platforms. It can store subscriber service configurations information internally, and act as a stateful bridge between the AAA system (for example, RADIUS and DHCP) and the SCE platforms.

Subscriber

Service Provider client. There are two types of subscribers:

- **Introduced Subscriber**—A specific subscriber with an externally generated name. May be mapped to more than one IP address.
- **Anonymous subscriber group**—A subscriber with a name generated automatically by the SCE platform according to an anonymous subscriber group specification. Always mapped to a single IP address. The actual identity of the subscriber is unknown to the system.

Subscriber-initiated transactions

Transactions that are initiated by a host of a subscriber.

Subscriberless mode

A mode of the Cisco Service Control solution that requires no integration, so that the SCMS-SM is not required. This mode is not influenced by the number of subscribers or inbound IP addresses; the total number of subscribers using the monitored link is unlimited from the perspective of the SCE platform. Use subscriberless mode at sites where control and level analysis functions are required only at a global platform resolution.

T**Traffic Discovery Reports**

Statistics reports on network activity based on transaction usage records.

Transaction (also called Session)

An event in traffic that is recognized by a service control application. A transaction is distinguished according to its Layer 3, Layer 4, or Layer 7 characteristics. Different protocols may have different transaction types.

U**Upstream traffic**

Traffic entering the SCE platform from the subscriber side.
